18.4.11.5.10 PRCM FSM State Observable Signals Description

Some of the observable signals encode the different PRCM finite state-machine (FSM) states. Each state corresponds to a combination of FSM output signal values. The states of the different FSMs associated with SAR RAM, DPLLs, EMIF, I/O controller, power manager, global reset manager warm reset generator, and clock managers, along with their corresponding output signal values (except for DPLLCtrl outputs) are described in [Table 18-43](#) through [Table 18-49](#).

| hwobs_dsi2dpll_clkout | DPLL_TESTCLKOUT | DSI2 DPLL | 0x4 |
| reserved | reserved | - | 0x5 |
| hwobs_usbdpll_clkout | PODPLLTESTCLKOUT | USB DPLL | 0x6 |
| reserved | reserved | - | 0x7 |

18.4.11.5.12 Other CORE DPLL Observable Signals

Table 18-51 describes the mapping of (other than CLKOUT) CORE DPLL observability signals to the SYSCTRL_GENERAL_CORE DPLL observing inputs. The selection of CORE DPLL as the source of the additional DPLL signals is done at the SYSCTRL_GENERAL_CORE level by setting the MULT bit field to 0x0 inside all of the eight registers, CONTROL_CONF_DPLL_FREQLOCK_SEL through CONTROL_CONF_DPLL_IDLE_SEL.

Table 18-51. Other CORE DPLL Observability Signals

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to CORE DPLL Observable Signals | Other CORE DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs | Signal Description | Logical Value Meaning |
|--------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|-------------------------------------------|-----------------------|
| hwobs_coredpll_freqlock | COREdpll_freqlock | CORE DPLL frequency lock check | – |
| hwobs_coredpll_tinitz | COREdpll_tinitz | Check CORE DPLL status, lock/relock time | – |
| hwobs_coredpll_phaselock | COREdpll_phaselock | CORE DPLL phase lock check | – |
| hwobs_coredpll_tenable | COREdpll_tenable | CORE DPLL Core RegM/N load enable input | – |
| hwobs_coredpll_tenablediv | COREdpll_tenablediv | CORE DPLL Core RegM2/N2 load enable input | – |

Table 18-51. Other CORE DPLL Observability Signals (continued)

| hwobs_coredpll_idle | COREdpll_idle | CORE DPLL idle mode input | – |

18.4.11.5.13 Other ABE DPLL Observable Signals

Table 18-52 describes the mapping of (other than CLKOUT) CORE DPLL observability signals to the SYSCTRL_GENERAL_CORE DPLL observing inputs. The selection of ABE DPLL as the source of the additional DPLL signals is done at the SYSCTRL_GENERAL_CORE level by setting the MULT bit field to 0x1 inside all of the eight registers, [CONTROL_CONF_DPLL_FREQLOCK_SEL](#) through [CONTROL_CONF_DPLL_IDLE_SEL](#).

Table 18-52. Other ABE DPLL Observability Signals

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to ABE DPLL Observable Signals | Other ABE DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs | Signal Description | Logical Value Meaning |
|--------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|-----------------------------------------|------------------------------|
| hwobs_abedpll_freqlock | dspdpll_freqlock | ABE DPLL frequency lock check | – |
| hwobs_abedpll_tinitz | dspdpll_tinitz | Check ABE DPLL status, lock/relock time | – |

| hwobs_abedpll_bypassack | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_abedpll_idle | dspDpllPhaseLock | dspDPLL phase lock check | – |

18.4.11.5.14 Other PERIPH DPLL Observable Signals

Table 18-53 describes the mapping of (other than CLKOUT) CORE DPLL observability signals to the SYSCTRL_GENERAL_CORE DPLL observing inputs. The selection of PERIPH DPLL as the source of the additional DPLL signals is done at the YSCTRL_GENERAL_CORE level by setting the MULT bit field to 0x2 inside all of the eight registers, [CONTROL_CONF_DPLL_FREQLOCK_SEL](#) through [CONTROL_CONF_DPLL_IDLE_SEL](#).

Table 18-53. Other PERIPH DPLL Observability Signals

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to PERIPH DPLL Observable Signals | Other PERIPH DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs | Signal Description | Logical Value Meaning |
|-----------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|--------------------------------------------|------------------------------|
| hwobs_perdpll_freqlock | PERIPHdpll_freqlock | PERIPH DPLL frequency lock check | – |
| hwobs_perdpll_tinitz | PERIPHdpll_tinitz | Check PERIPH DPLL status, lock/relock time | – |

Table 18-53. Other PERIPH DPLL Observability Signals (continued)

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to PERIPH DPLL Observable Signals | Other PERIPH DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs | Signal Description | Logical Value Meaning |

| hwobs_perdppll_idle | PERIPHDpllPhaseLock | PERIPH DPLL phase lock check | – |

18.4.11.5.15 Other DSI1 DPLL Observable Signals

Table 18-54 describes the mapping of (other than CLKOUT) CORE DPLL observability signals to the SYSCTRL_GENERAL_CORE DPLL observing inputs. The selection of DSI1 DPLL as the source of the additional DPLL signals is done at the SYSCTRL_GENERAL_CORE level by setting the MULT bit field to 0x3 inside all of the eight registers, [CONTROL_CONF_DPLL_FREQLOCK_SEL](#) through [CONTROL_CONF_DPLL_IDLE_SEL](#).

Table 18-54. Other DSI1 DPLL Observability Signals

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to DSI1 DPLL Observable Signals | Other DSI1 DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs | Signal Description | Logical Value Meaning |
|---------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|----------------------------------------|------------------------------|
| hwobs_dsi1dpll_freqlock | dspdppll_freqlock | dspDPLL frequency lock check | – |
| hwobs_dsi1dpll_tinitz | dspdppll_tinitz | Check dspDPLL status, lock/relock time | – |
| hwobs_dsi1dpll_phaselock | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_dsi1dpll_tenable | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_dsi1dpll_tenablediv | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_dsi1dpll_bypassack | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_dsi1dpll_idle | dspDpllPhaseLock | dspDPLL phase lock check | – |

18.4.11.5.16 Other DSI2 DPLL Observable Signals

Table 18-55 describes the mapping of (other than CLKOUT) CORE DPLL observability signals to the SYSCTRL_GENERAL_CORE DPLL observing inputs. The selection of DSI2 DPLL as the source of the additional DPLL signals is done at the SYSCTRL_GENERAL_CORE level by setting the MULT bit field to 0x4 inside all of the eight registers, [CONTROL_CONF_DPLL_FREQLOCK_SEL](#) through [CONTROL_CONF_DPLL_IDLE_SEL](#).

Table 18-55. Other DSI2 DPLL Observability Signals

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to DSI2 DPLL Observable Signals | Other DSI2 DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs | Signal Description | Logical Value Meaning |
|---------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|--------------------------------------------|------------------------------|
| hwobs_dsi2dpll_freqlock | PERIPHDpll_freqlock | PERIPH DPLL frequency lock check | – |
| hwobs_dsi2dpll_tinitz | PERIPHDpll_tinitz | Check PERIPH DPLL status, lock/relock time | – |
| hwobs_dsi2dpll_phaselock | PERIPHDpllPhaseLock | PERIPH DPLL phase lock check | – |
| hwobs_dsi2dpll_tenable | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_dsi2dpll_tenablediv | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_dsi2dpll_bypassack | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_dsi2dpll_idle | PERIPHDpllPhaseLock | PERIPH DPLL phase lock check | – |

18.4.11.5.17 Other USB DPLL Observable Signals

Table 18-56 describes the mapping of (other than CLKOUT) CORE DPLL observability signals to the SYSCTRL_GENERAL_CORE DPLL observing inputs. The selection of USB DPLL as the source of the additional DPLL signals is done at the SYSCTRL_GENERAL_CORE level by setting the MULT bit field MULT to 0x6 inside all of the eight registers, [CONTROL_CONF_DPLL_FREQLOCK_SEL](#) through [CONTROL_CONF_DPLL_IDLE_SEL](#).

Table 18-56. Other USB DPLL Observability Signals

| SYSCTRL_GENERAL_CORE Observability Inputs Tied to USB DPLL Observable Signals | Other USB DPLL Observable Signals Mapped to SYSCTRL_GENERAL_CORE Observability Inputs | Signal Description | Logical Value Meaning |
|--------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|------------------------------------------|------------------------------|
| hwobs_usbdpll_freqlock | dspdppll_freqlock | dspDPLL frequency lock check | – |
| hwobs_usbdpll_tinitz | dspdppll_tinitz | check dspDPLL status, lock / relock time | – |
| hwobs_usbdpll_phaselock | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_usbdpll_tenable | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_usbdpll_tenablediv | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_usbdpll_bypassack | dspDpllPhaseLock | dspDPLL phase lock check | – |
| hwobs_usbdpll_idle | dspDpllPhaseLock | dspDPLL phase lock check | – |

18.4.12 Functional Register Description

18.4.12.1 DSP Boot Register

Table 18-57 describes the DSP boot address register.

Table 18-57. DSP Boot Address Register

| Physical Address | Register Name | Description | Access |
|------------------|--------------------------------------|----------------------------------|--------|
| 0x4A00 2304 | CONTROL_DSP_BOOTADDR | DSP boot loader address register | R/W |

The [CONTROL_DSP_BOOTADDR](#) register defines the physical address for the DSP boot loader and drives the DSP_BOOTADDR[31:10] signals out from the control block to the DSP subsystem.

18.4.12.2 PBIASLITE Control Register

[Table 18-58](#) describes the [CONTROL_PBIASLITE](#) register, which controls some settings of PBIAS LITE cells for the MMC I/O interface.

Table 18-58. PBIAS Control Register

| Physical Address | Register Name | Description | Access |
|------------------|-----------------------------------|---------------------------------|--------|
| 0x4A10 0600 | CONTROL_PBIASLITE | Control settings for PBIAS cell | R/W |

For more information about the PBIAS cells, see [Section 18.4.9](#), *Extended-Drain I/O and PBIAS Cell*.

18.4.12.3 Temperature Sensor Control Register

[Table 18-59](#) describes the [CONTROL_TEMP_SENSOR](#) register, which controls the temperature sensor.

Table 18-59. Temperature Sensor Register

| Physical Address | Register Name | Description | Access |
|------------------|-------------------------------------|-------------------------------------|--------|
| 0x4A00 232C | CONTROL_TEMP_SENSOR | Temperature sensor control register | R/W |

18.4.12.4 CSI Receiver Control Register

To enable the physical layer of the camera receiver, the programmer manipulates the bits within the [CONTROL_CAMERA_RX](#) register.

Table 18-60. CSI Receiver control Register

| Physical Address | Register Name | Description | Access |
|------------------|-----------------------------------|---------------------------------|--------|
| 0x4A10 0608 | CONTROL_CAMERA_RX | Module dedicated configurations | R/W |

18.4.12.5 Protection Status Registers

[Table 18-61](#) lists the status registers.

Table 18-61. Protection Status Registers

| Physical Address | Register Name | Description | Access |
|------------------|----------------------------------------------|-------------------------------------------------|-------------------------------|
| 0x4A00 22D0 | CONTROL_SEC_ERR_STATUS_FUNC | Protection firewall error status register | Public (R) |
| 0x4A00 22D4 | CONTROL_SEC_ERR_STATUS_DEBUG | Protection firewall error status register debug | Public (RW Write 1 to Clear) |

These registers do not depend on the device type.

The [CONTROL_SEC_ERR_STATUS_FUNC](#) can be read in public mode, but cannot be written.

The [CONTROL_SEC_ERR_STATUS_DEBUG](#) register is both read and write accessible in GP devices.

These bits are cleared when the L3 and L4 firewall embedded error log registers are cleared. All bits in these registers reflect device internal events related to the device protection.

On a specific event (signal rising edge), the corresponding bit is set. On a rising edge, the input signal must stay high for at least two interface clocks periods to be recognized. Software must clear each bit after reviewing the events.

When a protection violation occurs, the following bits are set:

- In application mode
 - [CONTROL_SEC_ERR_STATUS_FUNC\[01\]](#) = L3RAM protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC\[02\]](#) = GPMC protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC\[03\]](#) = EMIF protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC\[04\]](#) = IVA-HD protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC\[05\]](#) = Dual Cortex™-M3 protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC\[06\]](#) = SL2 protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC\[13\]](#) = SGX protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC\[14\]](#) = Display subsystem protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC\[15\]](#) = ISS protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC\[16\]](#) = L4_PER protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC\[17\]](#) = L4_CFG protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC\[18\]](#) = DEBUGSS protection violation
 - [CONTROL_SEC_ERR_STATUS_FUNC\[19\]](#) = L4 AudioBE protection violation
- In debug mode
 - [CONTROL_SEC_ERR_STATUS_DEBUG\[01\]](#) = L3RAM protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG\[02\]](#) = GPMC protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG\[03\]](#) = EMIF protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG\[04\]](#) = IVA-HD protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG\[05\]](#) = Dual Cortex-M3 protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG\[06\]](#) = SL2 protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG\[13\]](#) = SGX protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG\[14\]](#) = Display subsystem protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG\[15\]](#) = ISS protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG\[16\]](#) = L4_PER protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG\[17\]](#) = L4_CFG protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG\[18\]](#) = DEBUGSS protection violation
 - [CONTROL_SEC_ERR_STATUS_DEBUG\[19\]](#) = L4 AudioBE protection violation

For more information about L4 firewall protection violation report mechanisms, see [Section 13.3.3.4.5, Firewall Error Logging in the Control Module](#). For more information about L3 firewall protection violation report mechanisms, see [Section 13.2.3.8, L3 Interconnect Error Analysis](#).

18.4.12.6 Protection SDRAM Configuration Registers

[Table 18-62](#) lists the protection SDRAM configuration registers for EMIF1 and EMIF2 that are part of the general wakeup control module. Upon POR, their values are exported as reset values of the EMIF1 and EMIF2 registers (EMIF_SDRAM_CONFIG and EMIF_SDRAM_CONFIG_2, respectively).

Table 18-62. Protection SDRAM Configuration Registers for EMIF1 and EMIF2

| Physical Address | Register Name | Description | Access |
|------------------|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|--------|
| 0x4A30C110 | CONTROL_WKUP_PROT_EMIF1_SDRAM_CONFIG_REG | Protection SDRAM configuration register 1, defining bit field reset values of the EMIF1.EMIF_SDRAM_CONFIG register | RW |

Table 18-62. Protection SDRAM Configuration Registers for EMIF1 and EMIF2 (continued)

| Physical Address | Register Name | Description | Access |
|------------------|-----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|--------|
| 0x4A30C114 | CONTROL_WKUP_PROT_EMIF1_SDRAM_CONFIG2_REG | Protection SDRAM configuration register 2, defining bit field reset values of the EMIF1.EMIF_SDRAM_CONFIG_2 register | RW |
| 0x4A30C118 | CONTROL_WKUP_PROT_EMIF2_SDRAM_CONFIG2_REG | Protection SDRAM configuration register 1, defining bit field reset values of the EMIF2.EMIF_SDRAM_CONFIG register | RW |
| 0x4A30C11C | CONTROL_WKUP_PROT_EMIF2_SDRAM_CONFIG2_REG | Protection SDRAM configuration register 2, defining bit field reset values of the EMIF2.EMIF_SDRAM_CONFIG_2 register | RW |

18.4.12.7 Register Controls for the LPDDR2IO1 and LPDDR2IO2 I/O Buffer Modes

There are global controls related to LPDDR2IO1 and LPDDR2IO2 (EMIF1 and EMIF2 associated) CA I/O receivers (loopback mode only) and DQ I/O receivers. These controls reside in the SYSCTRL_GENERAL_CORE.[CONTROL_GEN_CORE_OCPREG_SPARE](#) register.

[Figure 18-19](#) in [Section 18.4.12.8, Reference Voltage for OMAP LPDDR2IO1 and LPDDR2IO2 I/O Buffers and LPDDR2 Memory](#), shows how these controls are related to mode selection and powerdown controls for LPDDR2IO receivers.

Their functionality is as follows:

- Setting the OCPREG_SPARE[3] bit to 0b1 simultaneously disables (powers-down) all receivers associated with DQ groups of the LPDDR22 I/Os.
- Setting the OCPREG_SPARE[1] bit to 0b1, simultaneously disables (power-downs) all receivers associated with DQ groups of the LPDDR21 I/Os.
- Only the four DQ I/O groups receivers are impacted by the OCPREG_SPARE[1] and OCPREG_SPARE[3] bits as follows:
 - lpddr2x_dm0, lpddr2x_dqs0, lpddr2x_ndqs0, lpddr2x_dq [7:0]
 - lpddr2x_dm1, lpddr2x_dqs1, lpddr2x_ndqs1, lpddr2x_dq [15:8]
 - lpddr2x_dm2, lpddr2x_dqs2, lpddr2x_ndqs2, lpddr2x_dq [23:16]
 - lpddr2x_dm3, lpddr2x_dqs3, lpddr2x_ndqs3, lpddr2x_dq [31:24]
- Programming the OCPREG_SPARE[2] and OCPREG_SPARE[0] bits to 0b1 configures all the LPDDR2 DQ and CA (CA receivers enabled in a loopback mode only) I/O groups receivers to use low-voltage CMOS (LVCMOS) buffer logic, for the LPDDR22 and LPDDR21 I/Os, respectively.
- There is a single CA I/O group (lpddr2x_ca[0:9], lpddr2x_ncs0/1, lpddr2x_cke0/1, lpddr2x_ck, lpddr2x_nck) for the LPDDR21 and LPDDR22 command I/O lines. Programming the OCPREG_SPARE[2] and OCPREG_SPARE[0] bits to 0b0 configures all the LPDDR2 DQ and CA (loopback mode only) I/O groups receivers to use a true differential comparator logic (so called Vref-based receivers). For more details on the configuration of a Vref-based receiver, see [Section 18.4.12.8 Reference Voltage for OMAP LPDDR2IO1 and LPDDR2IO2 I/O Buffers and LPDDR2 Memory](#).

[Table 18-63](#) lists the register used to control the described EMIF1 and EMIF2 features.

Table 18-63. LPDDR2IO Buffer Control Register

| Physical Address | Register Name | Description | Access |
|------------------|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|
| 0x4A0023FC | CONTROL_GEN_CORE_OCPREG_SPARE | The lower 4 bits of this register are assigned to control the power-down mode for LPDDR2 DQ lines and select LVCMOS buffer or Vref-based receiver configuration for the LPDDR2 DQ/CA receivers. | RW |

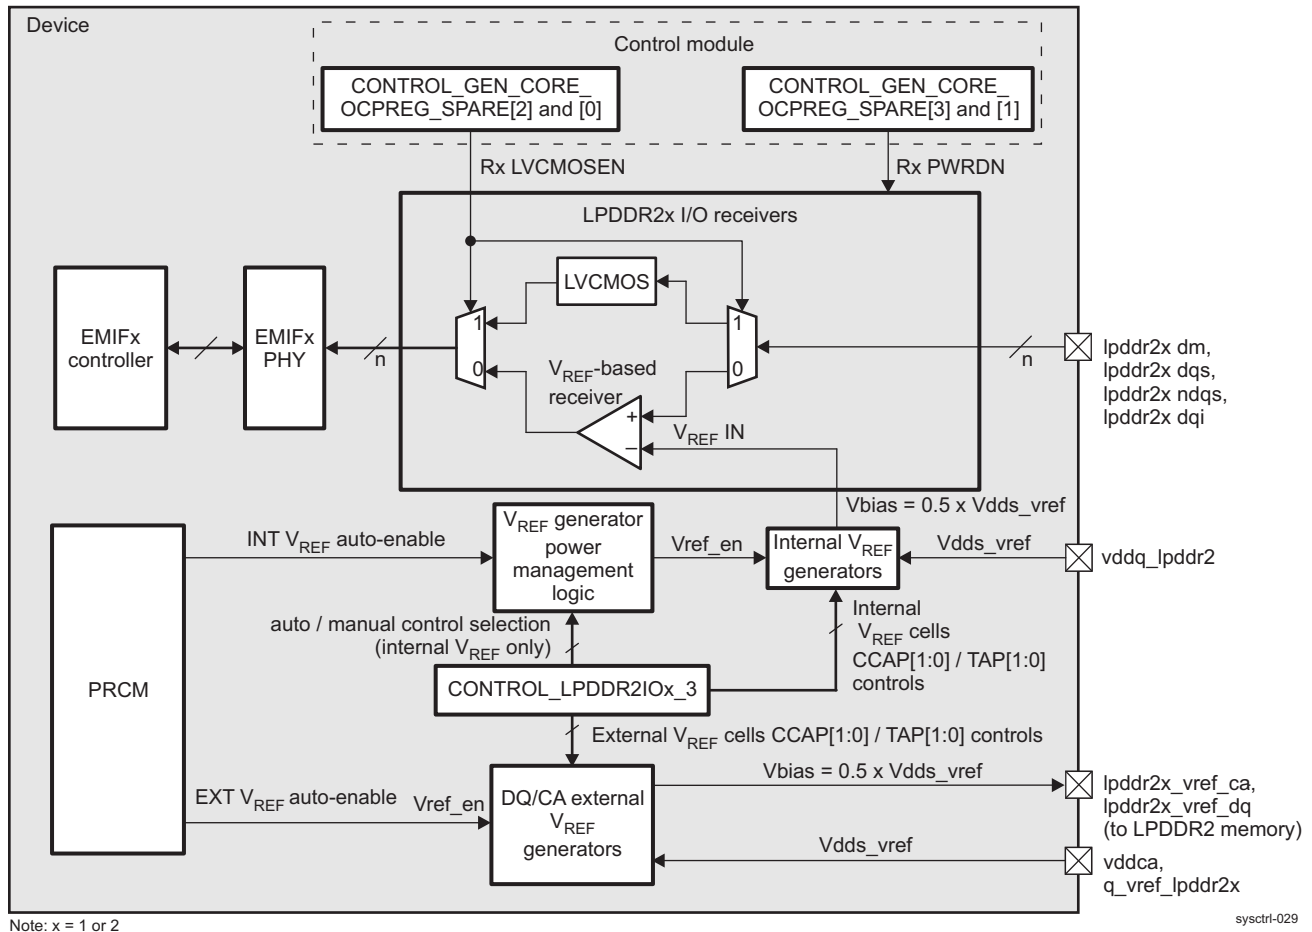

18.4.12.8 Reference Voltage for OMAP LPDDR2IO1 and LPDDR2IO2 I/O Buffers and LPDDR2 Memory

When device LPDDR2IO1 and LPDDR2IO2 I/O buffers are used in differential comparator mode (so called Vref based receivers), a reference voltage needs to be provided to the buffers. Several Vref-generation cells are integrated in the device to supply this internal reference voltage. Figure 18-19 provides the details about different controls related to the external and internal Vref generation cells for the differential comparator receivers.

When the Vref generator is turned on, it supplies voltage reference to the Vref-based receivers associated with the LPDDR2IO DQ and CA interface lines. In Vref-based receiver mode, the LPDDR2 I/O cell receiver is a true differential comparator with positive terminal connected to the device pad on which signal from LPDDR2 memory is received, and negative terminal tied to the VREF voltage generated on the Vbias output of the receiver corresponding Vref cell (see Figure 18-19).

The Vbias equals $0.5 \times V_{dds_vref}$, where V_{dds_vref} is power supply voltage of the Vref cell. The Vref-based receiver allows the improvement of speed performance at $V_{DD5} = 1.2\text{-V}$ I/O voltage supply. A reference voltage is also provided to externally attached LPDDR2 memory through the device `lpddr2x_vref_ca` and `lpddr2x_vref_dq` output pads. The same type of Vref-generation cells are used for these external reference voltages.

Figure 18-19. LPDDR2 Vref Cell and Receiver Type Controls

The voltage drive selection bit fields of these internal / external voltage reference cells are in the `CONTROL_LPDDR2IO1_3` and `CONTROL_LPDDR2IO2_3` registers. Individual `VREF_TAP[1:0]` control bits set the output drive capability for each reference voltage.

Table 18-64 lists the possible options for internal reference voltage drive selection.

Table 18-64. LPDDR2 Internal Reference Configuration

| VREF_TAP1 | VREF_TAP0 | Description |
|-----------|-----------|-----------------------------------------------------------------------------|
| 0 | 0 | Pad/bias2 Connected to reference Vdds_vref / 2, for 2- μ A current load |
| 0 | 1 | Pad/bias2 Connected to reference Vdds_vref / 2, for 4- μ A current load |
| 1 | 0 | Pad/bias2 Connected to reference Vdds_vref / 2, for 6- μ A current load |
| 1 | 1 | Pad/bias2 Connected to reference Vdds_vref / 2, for 8- μ A current load |

According to the noise environment, the user can choose to filter the reference voltage which is supplied.

Two coupling capacitors, internal to a Vref-generation cell, are available and are configurable as specified in [Table 18-65](#).

Table 18-65. LPDDR2 Vref Cell Decoupling Cap Selection

| VREF_CCAP0 | VREF_CCAP1 | Capacitor |
|------------|------------|--------------------------------------------------------------------------------------------------------------------|
| 0 | 0 | Capacitor between internal reference node (Vbias) and Vss (ground) |
| 0 | 1 | Capacitor between internal reference node (Vbias) and Vdds_vref as well as internal reference node (Vbias) and Vss |
| 1 | 0 | No capacitor connected |
| 1 | 1 | Capacitor between internal reference node (Vbias) and Vdds_vref |

Individual VREF_CCAP0 and VREF_CCAP1 control bits in the [CONTROL_LPDDR2IO1_3](#) and [CONTROL_LPDDR2IO2_3](#) registers set the coupling capacitor connection on VREF nodes.

For leakage improvement the Vref-generation cells can be enabled and disabled.

The Vref-generation cells used for the device internal Vref voltage are controlled by software. Setting bit [CONTROL_LPDDR2IOx_3\[0\]](#) LPDDR2x_INT_VREF_AUTO_EN_DQ = 0b1 or [CONTROL_LPDDR2IOx_3\[1\]](#) LPDDR2x_INT_VREF_AUTO_EN_CA = 0b1 (where x = 1, 2) enables the device PRCM automatic shut off or switch-on of the internal Vref cell generators associated with the LPDDR2x interface, DQ and CA lines, respectively.

If user software sets the manual control bit [CONTROL_LPDDR2IOx_3\[2\]](#) LPDDR2x_INT_VREF_EN_DQ=0b1 or [CONTROL_LPDDR2IOx_3\[2\]](#) LPDDR2x_INT_VREF_EN_CA =0b1, internal Vref cell generators are enabled, regardless of the state of the LPDDR2x_INT_VREF_AUTO_EN_DQ / LPDDR2x_INT_VREF_AUTO_EN_CA bits. Thus, PRCM automatic control over the internal Vref cell generators can always be overridden in the context of enabling the Vref generator.

In contrast to the internal Vref source generator cells, which enable/disable-control can be selected in software between PRCM and manual software control, the Vref-generation cells used for the external Vref output generation are controlled only by the PRCM.

[Table 18-66](#) provides different combinations of Vref cell control types and the state of the Vref cell.

Table 18-66. LPDDR2 Vref Cells State Description

| LPDDR2x_INT_VREF_EN_DQ /CA (Manual Control Bits) | LPDDR2x_INT_VREF_AUTO_EN_DQ/CA (AUTO Control Bits) | Type of Control | Vref Cell State |
|--------------------------------------------------|----------------------------------------------------|-----------------|--------------------------------|
| 1 | x | Manual | Enabled |
| 0 | 1 | AUTO | Automatically enabled/disabled |
| 0 | 0 | – | Disable |

There are 4 internal VREF cells ($k = 0$ to 3) associated with DQ line receivers and a single internal VREF cell associated with CA line receivers (loopback mode only) for each of the device LPDDR21 and LPDDR22 set of I/Os. The group assignment of a VREF cell Vbias output to different I/Os associated Vref-based receivers is covered in [Table 18-67](#)

Table 18-67. Internal VREF Generators CCAP and TAP Controls versus LPDDR2IO Receiver Pads

| Control Module Register | LPDDR21 Pads | Internal Vref cell TAP / CCAP controls associated to device LPDDR21 pad corresponding Vref-based receivers |
|-------------------------------------|--------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| CONTROL_LPDDR2IO1_3 | lpddr21_dm0, lpddr21_dqs0, lpddr21_ndqs0, lpddr21_dq[7:0] | LPDDR21_VREF_DQ_INT0_TAP/CCAP |
| | lpddr21_dm1, lpddr21_dqs1, lpddr21_ndqs1, lpddr21_dq[15:8] | LPDDR21_VREF_DQ_INT1_TAP/CCAP |
| | lpddr21_dm2, lpddr21_dqs2, lpddr21_ndqs2, lpddr21_dq[23:16] | LPDDR21_VREF_DQ_INT2_TAP/CCAP |
| | lpddr21_dm3, lpddr21_dqs3, lpddr21_ndqs3, lpddr21_dq[31:24] | LPDDR21_VREF_DQ_INT3_TAP/CCAP |
| | lpddr21_ca[9:0], lpddr21_ncs0, lpddr21_ncs1, lpddr21_cke0, lpddr21_cke1, lpddr21_ck, lpddr21_nck | LPDDR21_VREF_CA_INT_TAP/CCAP |
| Control Module Register | LPDDR22 Pads | Internal Vref cell TAP / CCAP controls associated to device LPDDR21 pad corresponding Vref-based receivers |
| CONTROL_LPDDR2IO2_3 | lpddr22_dm0, lpddr22_dqs0, lpddr22_ndqs0, lpddr22_dq[7:0] | LPDDR22_VREF_DQ_INT0_TAP/CCAP |
| | lpddr22_dm1, lpddr22_dqs1, lpddr22_ndqs1, lpddr22_dq[15:8] | LPDDR22_VREF_DQ_INT1_TAP/CCAP |
| | lpddr22_dm2, lpddr22_dqs2, lpddr22_ndqs2, lpddr22_dq[23:16] | LPDDR22_VREF_DQ_INT2_TAP/CCAP |
| | lpddr22_dm3, lpddr22_dqs3, lpddr22_ndqs3, lpddr22_dq[31:24] | LPDDR22_VREF_DQ_INT3_TAP/CCAP |
| | lpddr22_ca[9:0], lpddr22_ncs0, lpddr22_ncs1, lpddr22_cke0, lpddr22_cke1, lpddr22_ck, lpddr22_nck | LPDDR22_VREF_CA_INT_TAP/CCAP |

Different LPDDR2x_VREF_DQ / CA_INTk_TAP[1:0], LPDDR2x_VREF_DQ / CA_INTk_CCAP[1:0] bit fields from the [CONTROL_LPDDR2IO1_3](#) (for LPDDR2IO1 Vref cells) and [CONTROL_LPDDR2IO2_3](#) (for LPDDR2IO2 Vref cells) registers, apply to $k = 4$ different DQ groups and a single group of CA I/Os per LPDDR2 I/O set, as specified in [Table 18-67](#).

The LPDDR2x_VREF_DQ[1:0] or CA_TAP[1:0] bit fields, and LPDDR2x_VREF_DQ[1:0] or CA_CCAP[1:0] bit fields are used to set the output drive capability and coupling capacitors at the Vbias node of the DQ/CA external Vref generation cells.

In contrast to VREF_TAP and VREF_CCAP (which are individual per LPDDR2x I/O group), the LPDDR2x_INT_VREF_EN_DQ, LPDDR2x_INT_VREF_EN_CA, LPDDR2x_INT_VREF_AUTO_EN_DQ, and LPDDR2x_INT_VREF_AUTO_EN_CA bit fields act as common controls to all internal Vref generator cells.

NOTE: The CA and DQ Vref-generation cells used as external Vref output generators are controlled only by the PRCM.

18.4.12.9 Signal Integrity Parameter Control Registers With Pad Group Assignment

18.4.12.9.1 Signal Integrity Parameter Controls Overview

Most of the I/O cells associated with the device pads are configurable to deliver their carried signals to the targeted sink with maximum signal integrity. These I/Os are configured by pad group assignment and not individually per pad.

The different I/O-specific requirements determine the use of different types of I/O cells for the device I/Os. Software controls associated with the signal integrity parameters are implemented at the SYSCTRL_PADCONF_CORE and SYSCTRL_PADCONF_WKUP levels.

The following types of I/O cells associated with pad groups can be identified:

- LPDDR2 high-speed I/O cells with impedance (I), slew rate (SR), and weak driver (WD) settings
- High-speed I/O cells with far-end load (LB) settings
- Low-speed I/O cells with combined slew rate (SC) and load versus transmission line (TL) length -(LB) settings
- Two types of I/O cells with mode (MB) controls and load compensation (LB) settings with a difference in typical output impedance
- I/O cells with control (DS0) of the impedance mode
- SDMMC2 or GPMC I/O cells with LB0 control adjustable according to interface requirement/voltage mode
- I/O cells with pullup strength (PUSTRENGTH) and speed controls
- I2Cx I/O cells with pullup resistance vs capacitance load settings
- JTAG™ I/O cells with bus-holder enable control

NOTE: I/Os are non-failsafe, which means that voltage must never be applied at a pad before the internal I/O supply voltage VDDS is powered.

The pad group-assigned signal integrity controls are provided through the registers described in [Table 18-68](#).

Table 18-68. Signal Integrity Parameter Control Registers

| Physical Address | Register Name | Description | Access |
|------------------|--------------------------------------------|--------------------------------------------------------|--------|
| 0x4A10 05A8 | CONTROL_SMART1IO_PADCONF_0 | Signal integrity pad group assignment control register | R/W |

18.4.12.9.2 High-Speed I/O Buffers With Impedance, Slew Rate, and Weak Driver Settings

The LPDDR2IO (EMIF) buffers are based on high-speed unterminated logic and require excellent driver impedance control to achieve optimal timing–EMI trade-offs. A specific type of device I/O cell with programmable features is used to meet this requirement. These I/O cells also support high-speed interchip (HSIC) interface.

Two types of software configurable I/O cells are integrated to support high-speed unterminated logic:

- Single-ended I/O cells
- Two-pad differential I/O cells

Two-pad differential I/O cells are provided with a differential receiver and a complementary transmitter. They are used to support the LPDDR2 clock pads (lpddr21_ck, lpddr21_nck, lpddr22_ck, lpddr22_nck) and LPDDR2 strobe pads (lpddr21_dqsi, lpddr21_ndqsi, lpddr22_dqsi, lpddr22_ndqsi, where i = 0 to 3).

A LPDDR2 bidirectional-I/O cell receiver (Rx) can be configured to operate as a LVCMOS buffer and as a true differential comparator with a reference voltage (Vref input [a so called Vref-based receiver]). For more information on LPDDR2 I/O receiver-buffer type selection and power management controls, see [Section 18.4.12.7, Register Controls for the LPDDR2IO1 and LPDDR2IO2 I/O Buffer Modes](#).

In addition, several Vref-generation cells are integrated in the device to supply reference voltage (Vref) to receiver buffers (when configured to operate as Vref-based receivers), and to provide Vref to externally-attached LPDDR2 memory. For more details on the functionality and controls of device Vref generation cells, see [Section 18.4.12.8, Reference Voltage for OMAP LPDDR2IO1 and LPDDR2IO2 I/O Buffers and LPDDR2 Memory](#).

These LPDDR2x cells are integrated with the following controls located in the SYSCTRL_PADCONF_CORE module:

- Driver output impedance (I) controls
- SR controls
- WD controls to support LPDDR2/HSIC interface and avoid floating pad
- Process-only impedance compensation using 5-bit binary coded schema separately for pullup p<1:5> and pulldown n<1:5> impedance

Programmable bits for impedance and SR control are provided when the I/Os are set to operate in driver mode (outputs).

The bits I[2:0] are used to program desired impedance value of the driver .

The drive strengths corresponding to the I[2:0] value are aliased as Drv i (where i = 5 to 12) in the CONTROL_LPDDR2IO1_x and CONTROL_LPDDR2IO2_x, (where x = 0 to 2) register tables in [Section 18.6.7](#), *SYSCTRL_PADCONF_CORE Register Description*.

CAUTION

To ensure the best performance of the LPDDR2 I/Os, it is strongly recommended for user software to always set the impedance controlling bits (I) in the CONTROL_LPDDR2IO1_x and CONTROL_LPDDR2IO2_x registers (where x = 0 to 2) to 0x7, which corresponds to Drv12 mode.

For more information about LPDDR2 I/O-specific driver output impedance (respectively corresponding drive strength) parameter, see the *Electrical Characteristics/DC Electrical Characteristics/LPDDR2 DC Electrical Characteristics* section in the device data manual.

User software can program the slew rate (turn-on time) of the output signal using the control bits SR[1:0] in the CONTROL_LPDDR2IO1_x and CONTROL_LPDDR2IO2_x (where x = 0 to 2) registers.

For more information about the LPDDR2 I/O slew rate parameter control, SR[1:0], see the *Electrical Characteristics/DC Electrical Characteristics/LPDDR2 DC Electrical Characteristics* section in the device data manual.

Weak pullup, pulldown, or a keeper on pad is enabled through bits wd0 and wd1. Weak pullup, pulldown option is used to define the pad state (high or low) when no signal is driving the pad. The weak keeper option is used to maintain the previous output value, when nothing is driving the pad. [Table 18-69](#) describes the WD controls.

NOTE: The WD[1:0] bit field controls play the role of the PULLTYPESELECT and PULLUDENABLE bits within the standard pad configuration registers, additionally providing the keeper function to the I/Os with the state WD = 0b11. For LPDDR2 I/Os, the WD controls do not apply during off mode.

CAUTION

To ensure the best performance of the LPDDR2 I/Os, it is strongly recommended for user software to always set the slew rate (SR) control bit field in the CONTROL_LPDDR2IO1_x and CONTROL_LPDDR2IO2_x registers (where x = 0 to 2) to 0b01.

It is also recommended to set the weak driver (WD) in the CONTROL_LPDDR2IO1_x and CONTROL_LPDDR2IO2_x registers to 0b10 (weak pull-down).

Similar to the lpddr1_x and lpddr2_x pads, the usbb1_hsic_data/strobe and usbb2_hsic_data/strobe pads also have weak driver software controls for active-mode internal weak pullups and pulldowns. They are in the [CONTROL_USBB_HSIC](#) register.

In contrast to the LPDDR2 I/Os, the usbb1_hsic and usbb2_hsic pads are additionally provided with bits in the same register to select weak pullup/down and keeper function during off mode. For a given usbbx_hsic_data/strobe pad (where x = 1, 2) the associated bit to allow an off-mode-specific pullup/pulldown/keeper setting is OFFMODE_WD_ENABLE. The off mode option is defined through the OFFMODE_WD[1:0] bit field in the [CONTROL_USBB_HSIC](#) register.

Table 18-69. Weak Driver PUPD/Latch Mode

| WD1 | WD0 | Operation |
|-----|-----|-----------------------|
| 0 | 0 | Pull logic disabled |
| 0 | 1 | Weak pullup enabled |
| 1 | 0 | Weak pulldown enabled |
| 1 | 1 | Weak keeper enabled |

The following sequence is required to program the off-mode pullup/pulldown/latch (keeper) feature of the usbb1_hsic_data/usbb2_hsic_data and usbb1_hsic_strobe/usbb2_hsic_strobe pads:

1. Program the desired values for USBB1_HSIC_DATA_OFFMODE_WD/USBB2_HSIC_DATA_OFFMODE_WD and USBB1_HSIC_STROBE_OFFMODE_WD/USBB2_HSIC_STROBE_OFFMODE_WD in the [CONTROL_USBB_HSIC](#) register.
2. For an off-mode pullup/pulldown configuration different than the active mode pullup/pulldown configuration, set the USBB1_HSIC_DATA_OFFMODE_WD_ENABLE/USBB2_HSIC_DATA_OFFMODE_WD_ENABLE and USBB1_HSIC_STROBE_OFFMODE_WD_ENABLE/USBB2_HSIC_STROBE_OFFMODE_WD_ENABLE bits to 1.

If USBB1_HSIC_DATA_OFFMODE_WD_ENABLE/USBB2_HSIC_DATA_OFFMODE_WD_ENABLE is set to 0, the applied value of the pullup/pulldown after the device goes to off mode will be same as the value of the active pullup/pulldown (that is, in this case, the value of the OFFMODE PU/PD bit field is disregarded).

If, for example, USBB1_HSIC_DATA_OFFMODE_WD/USBB2_HSIC_DATA_OFFMODE_WD is programmed with the same setting as USBB1_HSIC_DATA_WD/USBB2_HSIC_DATA_WD, then the value of USBB1_HSIC_DATA_OFFMODE_WD_ENABLE/USBB2_HSIC_DATA_OFFMODE_WD_ENABLE does not matter.

Therefore,

USBB1_HSIC_DATA_OFFMODE_WD_ENABLE/USBB2_HSIC_DATA_OFFMODE_WD_ENABLE and USBB1_HSIC_STROBE_OFFMODE_WD_ENABLE/USBB2_HSIC_STROBE_OFFMODE_WD_ENABLE apply only to off-mode pullup/pulldown selection.

The eFuse impedance compensation settings are exported upon POR to 10 bits in the [CONTROL_EFUSE_2](#) register of the device control module as follows:

- [CONTROL_EFUSE_2\[23\]](#) LPDDR2_PTV_N1 through [CONTROL_EFUSE_2\[19\]](#) LPDDR2_PTV_N5 (pulldown impedance trimming)
- [CONTROL_EFUSE_2\[18\]](#) LPDDR2_PTV_P1 through [CONTROL_EFUSE_2\[14\]](#) LPDDR2_PTV_P5 (pullup impedance trimming)

CAUTION

Do not override the eFuse impedance compensation settings in the [CONTROL_EFUSE_2](#) register.

NOTE: There is no software control (INPUTENABLE) for the input buffer of the high-speed unterminated logic I/Os associated with the lpddr21_x, lpddr22_x, usbb1_hsic_data/strobe, and usbb2_hsic_data/strobe pads. If the CMOS buffer is enabled, it is always bidirectional (that is, the input buffer is always enabled).

18.4.12.9.3 Low-Speed I/Os Combined Slew Rate Versus TL Length and Load Settings

The low-speed I/O cells slew modes are selectable through the slew mode control SC[1:0] bit field. These settings act like coarse settings for the signal performance behavior of the low-speed I/Os. The slew rate settings determine three target maximal frequencies of I/O operation at maximum load (see [Table 18-70](#))

The low-speed I/O cells far-end capacitance load can be selected according to the transmission line (TL) length settings by modifying the load bits LB[1] and LB[0] appropriately. The four possible load bit settings described in [Table 18-71](#) are fully applicable and have maximum effect only when slew control mode 0 is selected. These settings fine tune the signal performance.

The pads featuring low-speed I/O cells require different SC[1:0] and LB[1:0] bit field settings to achieve optimal electrical performance for the multiplexed interface. This behavior may depend on various factors:

- [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), describes the different interfaces that have SC[1:0] and LB[1:0] controls and their pad corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics* section of the device data manual provides more information about the specific SC[1:0] and LB[1:0] bit field settings applicable to these interfaces multiplexed to low-speed I/O pads.
- The *Timing Parameters* section of the device data manual provides the exact system conditions (far end load, trace length, etc.) at which pad-multiplexed interface I/O timing parameters reach their boundary values.

Table 18-70. Slew Control Mode (Coarse) Settings

| SC[1] bit | SC[0] bit | Slew Rate Control Mode | Maximum Frequency Achieved at Maximum Load |
|-----------|-----------|------------------------|--------------------------------------------|
| 0 | 0 | 0 | 20 MHz |
| 0 | 1 | 1 | 60 MHz |
| 1 | 0 | 2 | 40 MHz |

Table 18-71. Load Bit (Fine) Settings

| LB[1] (CLoad Capacitance Control) | LB[0] (TL-Length Control) | Effective TL Length (cm) | CLoad Capacitance (pF) (per TL) |
|-----------------------------------|---------------------------|--------------------------|---------------------------------|
| 0 | 0 | 2–20 | 1–10 |
| 0 | 1 | 20–40 (dual TL) | 1–10 |
| 1 | 0 | 2–20 | 10–20 |
| 1 | 1 | 20–40 (dual TL) | 10–20 |

NOTE: The load bit modes in [Table 18-71](#) are fully applicable and have maximum effect only in the case of slew control mode 0 (SC[1:0] = 00). For slew control modes 1 and 2, LB[1:0] = 0b11 is recommended.

18.4.12.9.4 I/Os With Combined Mode and Load Settings

There are two subtypes (conditionally described as type 1 and type 2 throughout this chapter) of device I/Os, with combined mode and load settings, that differ primarily in typical output impedance and mode-specific performance. Type 1 I/Os feature a lower typical output impedance than type 2.

Both I/Os have an output buffer with an internal pad voltage SR control mechanism. Each of the type 1 and type 2 corresponding I/O cells is controlled from 2 mode bits (MB0 and MB1) and a dedicated bit (LB0) for load compensation. LB0 programs the $C_{far\ end\ load}$ for the I/O cell associated pads. [Table 18-72](#) describes the mode bit settings for each mode and lists the load bit settings.

Table 18-72. Software Controls for I/Os With Combined Mode and Load Settings

| Mode | MB1 | MB0 | LB0 |
|--------------------|-----|-----|-------------------------------------------------------------------------------------------------|
| Mode 1 – SDMMC/SPI | 0 | 1 | 0 |
| Mode 2 - DMIC/GPIO | 1 | 0 | 0: ($C_{far\ end\ load}^{(1)} < 15\text{pf}$) 1: ($C_{far\ end\ load} \geq 15\text{pf}$) |
| Mode 3 – HSI | 1 | 1 | 0: ($C_{far\ end\ load} < 5\text{pf}$) 1: ($C_{far\ end\ load} \geq 5\text{pf}$) |
| Mode 4 - ULPI | 1 | 1 | 0: ($C_{far\ end\ load} < 4\text{pf}$) 1: ($C_{far\ end\ load} \geq 4\text{pf}$) |

⁽¹⁾ The $C_{far\ end\ load}$ is the external capacitance load applied at the far end of the pad signal transmission line.

The *Electrical Characteristics / DC Electrical Characteristics* section of the device data manual provides more information on the specific MB[1:0] and LB[1:0] bit field settings applicable to different interfaces multiplexed to I/O pads with combined mode and load settings. The *Timing Parameters* section of the device data manual provides the exact system conditions (far end load, trace length, etc.) at which pad-multiplexed interface I/O timing parameters reach their boundary values.

The pads featuring type 1 and type 2 I/O cells with combined mode and load settings require different MB[1:0] and LB0 bit field settings to achieve optimal electrical performance for the multiplexed interface. This behavior may depend on various factors:

- [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), describes the different interfaces that have type 1 and type 2 MB and LB0 controls and the type 1 and type 2 I/O cell pad corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics* section of the device data manual provides more information about the specific MB[1:0] and LB0 bit field settings applicable to these interfaces multiplexed to type 1 and type 2 I/O pads with combined mode and load controls.

A process-only compensation using 4-bit binary coded schema is used separately for pullup/down output parameter variations.

For type 1 I/Os, only mode 2 does not use such compensation.

For type 2 I/Os, only mode 1 and mode 2 use eFuse process-only compensation to reduce the spread in timing parameters.

The I/Os with combined mode and load controls share the same compensation settings with the I/Os with driver output impedance (DS) settings as well as with the SDMMC2 or GPMC I/O buffers. They are exported from eFuse upon POR to the following bits in the [CONTROL_EFUSE_2](#) register:

- [CONTROL_EFUSE_2\[31\]](#) EFUSE_SMART2TEST_P0 through [CONTROL_EFUSE_2\[28\]](#) EFUSE_SMART2TEST_P3 (pullup output parameters trimming)
- [CONTROL_EFUSE_2\[27\]](#) EFUSE_SMART2TEST_N0 through [CONTROL_EFUSE_2\[24\]](#) EFUSE_SMART2TEST_N3 (pulldown output parameters trimming)

CAUTION

Do not override the SMART2TEST_P/SMART2TEST_N eFuse compensation settings in the [CONTROL_EFUSE_2](#) register.

18.4.12.9.5 I/O Cells With Configurable Impedance Mode

The impedance mode at which this type of I/O cell operates is selected by setting a single bit drive strength control, DS0, as follows:

- DS0 = 1 selects mode 1, corresponding to 25-Ω impedance mode

- DS0 = 0 selects mode 2, corresponding to 50-Ω impedance mode

The pads featuring I/O cell with configurable impedance mode require different DS0 bit settings to achieve optimal electrical performance for the multiplexed interface. This behavior may depend on various factors:

- [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), describes the different interfaces that have DS0 impedance mode control and the pad corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics* section of the device data manual provides more information about the specific DS0 bit settings applicable to these interfaces multiplexed to I/O pads with configurable impedance mode.

A process-only compensation using 4-bit binary coded schema is used separately for pullup/down output parameter variations. Only mode 1 and mode 2 use eFuse process-only compensation to reduce spread in timing parameters. The I/Os with DS0 impedance mode control share the same compensation settings with the I/Os with combined mode and load controls (both type 1 and type 2) as well as with the SDMMC2 or GPMC I/O buffers. They are exported from eFuse upon POR to the following bits in the [CONTROL_EFUSE_2](#) register:

- [CONTROL_EFUSE_2\[31\]](#) EFUSE_SMART2TEST_P0 through [CONTROL_EFUSE_2\[28\]](#) EFUSE_SMART2TEST_P3 (pullup output parameters trimming)
- [CONTROL_EFUSE_2\[27\]](#) EFUSE_SMART2TEST_N0 through [CONTROL_EFUSE_2\[24\]](#) EFUSE_SMART2TEST_N3 (pulldown output parameters trimming)

18.4.12.9.6 SDMMC2 or GPMC I/O Cells With Load Setting Adjustable According to Interface Requirement /Voltage Mode

To configure this type of I/O cell for different interfaces multiplexed on it, the user must manipulate in software a single bit, LB0, depending on type of multiplexed interface (GPMC, or SDMMC2) of the pad and the selected I/O voltage supply mode. Like LPDDR2IO, this I/O cell is provided with selectable LVCMOS and Vref-based receiver option. A Vref pad is provided to supply reference voltage to the receiver in the 1.2-V mode. To save power at lower frequency operation, LVCMOS receiver can be selected, and 2 bits, for each of the two SDMMC2 or GPMC pad groups, are used to enable and disable the LVCMOS receiver, CMOSEN_C2C_FRM_CTRL, manually in the [CONTROL_C2CIO_PADCONF_0](#) register.

The pads featuring SDMMC2 or GPMC I/O cells with load setting adjustable according to interface requirement/voltage mode require different LB0 bit settings to achieve optimal electrical performance for the multiplexed interface. This behavior may depend on various factors:

- [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), describes the different interfaces that have the interface type versus voltage mode control (LB0) and the pad corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics* section of the device data manual provides more information about the specific LB0 bit settings applicable to these interfaces multiplexed to I/O pads with configurable impedance mode.

NOTE: No bits are assigned to control the output drive capability of the internal SDMMC2 or GPMC Vref generator (at the c2c_vref pad). It is fixed to a 2-μA current load.

If 1.2-V voltage mode is selected, the user can choose to have the LVCMOS receiver or Vref-based receiver on the SDMMC2 or GPMC I/O cell pads. For the description of the dual-voltage mode settings of the SDMMC2 or GPMC I/O cell pads, see [Section 18.4.12.10, Dual Voltage-Supplied Peripheral Controls](#).

In Vref-based receiver mode, the SDMMC2 or GPMC I/O cell receiver is a true differential comparator with pad connected to the positive terminal and Vref tied to the negative terminal. The Vref-based receiver allows the improvement of speed performance at VDDS = 1.2-V I/O voltage supply.

NOTE: The Vref-based receiver is not supported in 1.8-V mode. In this mode, the LVCMOS receiver is the only option.

NOTE: While at VDDS = 1.2 V, the LVCMOS receiver is supported for all SDMMC2 or GPMC I/O cell pads. The Vref-based receiver is supported on only some of these pads.

Two bits, [CONTROL_C2CIO_PADCONF_0\[12\]](#) CMOSEN_C2C_0_FRM_CTRL and [CONTROL_C2CIO_PADCONF_0\[11\]](#) CMOSEN_C2C_1_FRM_CTRL, each related to a separate group of pads, are dedicated to select Vref-based receiver mode or LVCMOS receiver mode when VDDS = 1.2 V is selected in the [CONTROL_CORE_PADCONF_MODE](#) register.

CMOSEN_C2C_0_FRM_CTRL = 1 enables the 1.2-V mode LVCMOS receiver, and
CMOSEN_C2C_0_FRM_CTRL = 0 enables the 1.2-V Vref-based receiver for the following pads:

- gpmc_ad8–gpmc_ad15
- gpmc_ncs4
- gpmc_ncs5

CMOSEN_C2C_1_FRM_CTRL = 1 enables the 1.2-V mode LVCMOS receiver and
CMOSEN_C2C_1_FRM_CTRL = 0 enables the 1.2-V Vref-based receiver for the following pads:

- gpmc_a16–gpmc_a23

NOTE: The Vref-based receiver in 1.2-V mode is not supported for the following SDMMC2 or GPMC I/O cell pads:

- gpmc_ad0–gpmc_ad7
 - gpmc_a24
 - gpmc_a25
 - gpmc_ncs0–gpmc_ncs3
 - gpmc_clk
 - gpmc_nadv_ale
 - gpmc_noe
 - gpmc_nwe
 - gpmc_nbe0_cle
 - gpmc_nbe1
 - gpmc_wait1
 - gpmc_wait2
 - gpmc_ncs6
 - gpmc_ncs7
-

When the internal Vref generator is turned on, it supplies voltage reference to the Vref-based receivers supported for some SDMMC2 or GPMC I/O cell pads and can also be used to drive external modules with 1.2-V reference. In this case, the c2c_vref device pad outputs voltage of the internal SDMMC2 or GPMC Vref cell.

Setting bit [CONTROL_C2CIO_PADCONF_0\[7\]](#) C2C_INT_VREF_AUTO_EN = 0b1 enables the automatic shut-off or switch-on of the internal Vref cell generator.

If user software sets the manual control bit [CONTROL_C2CIO_PADCONF_0\[8\]](#) C2C_INT_VREF_EN = 0b1, the internal Vref cell generator is enabled, regardless of the state of the [CONTROL_C2CIO_PADCONF_0\[7\]](#) C2C_INT_VREF_AUTO_EN bit. Thus, automatic control over the SDMMC2 or GPMC Vref cell generator can always be overridden in the context of enabling the Vref generator.

If the Vref cell generator is enabled, the c2c_vref pad acts as output and can be used to supply reference voltage to external devices.

NOTE: At VDDS = 1.8-V voltage mode, the internal reference generator is shut off and the internal Vref cell reference node is connected to 0.

For the description of the dual-voltage mode settings of the SDMMC2 or GPMC I/O cell pads, see [Section 18.4.12.10, Dual Voltage-Supplied Peripheral Controls](#).

CAUTION

While using the Vref cell in internal reference mode, nothing else must drive the pad externally, although the pad can be connected to supply the Vref signal to other devices.

When the internal Vref cell generator is disabled and bypassed, which is provided when [CONTROL_C2CIO_PADCONF_0\[8\]](#) C2C_INT_VREF_EN = 0b0 and [CONTROL_C2CIO_PADCONF_0\[7\]](#) C2C_INT_VREF_AUTO_EN = 0b0, the c2c_vref pad acts as input that can supply voltage reference to the Vref-based receivers from external sources.

[Table 18-73](#) lists different combinations of Vref cell control types, the state of the Vref cell, and the associated voltage reference pad direction.

Table 18-73. SDMMC2 or GPMC Vref Cell State Description

| C2C_INT_VREF_EN (Manual Control Bits) | C2C_INT_VREF_AUTO_EN (AUTO Control Bits) | Type of Control | Vref Cell State | Voltage Reference Pad Direction |
|------------------------------------------|---------------------------------------------|-----------------|-----------------------------------|------------------------------------|
| 1 | x | Manual | Enabled | O |
| 0 | 1 | AUTO | Automatically enabled/disabled | O |
| 0 | 0 | – | Disabled and bypassed | I |

CAUTION

The c2c_vref pad must be externally driven only in 1.2-V voltage mode.

According to the noise environment, the user can select to filter the reference voltage, which is supplied at the internal VREF node (receiver comparators Vref input) by the Vref cell generator or by an external source. Two coupling capacitors, internal to the SDMMC2 or GPMC Vref cell, are available at the internal VREF node, which is configurable, as specified in [Table 18-74](#).

Table 18-74. SDMMC2 or GPMC Vref Cell Decoupling Cap Selection

| VREF_CCAP0 | VREF_CCAP1 | Capacitor |
|------------|------------|------------------------------------------------------------------------------------------------|
| 0 | 0 | No capacitor connected |
| 0 | 1 | Capacitor between internal reference node and VDD5 |
| 1 | 0 | Capacitor between internal reference node and VSS |
| 1 | 1 | Capacitor between internal reference node and VDD5 and between internal reference node and VSS |

A process-only compensation using 4-bit binary coded schema is used separately for pullup/down output parameter variations. The SDMMC2 or GPMC I/O buffers share the same compensation settings with the I/Os with combined mode and load controls (both with 25- and 50-Ω output) and I/Os with driver output impedance (DS) settings. They are exported from eFuse upon POR to the following bits in the [CONTROL_EFUSE_2](#) register:

- [CONTROL_EFUSE_2\[31\]](#) EFUSE_SMART2TEST_P0 through [CONTROL_EFUSE_2\[28\]](#) EFUSE_SMART2TEST_P3 (pullup output parameters trimming)
- [CONTROL_EFUSE_2\[27\]](#) EFUSE_SMART2TEST_N0 through [CONTROL_EFUSE_2\[24\]](#) EFUSE_SMART2TEST_N3 (pulldown output parameters trimming)

18.4.12.9.7 SDMMC1 Pullup Strength Control

The SDMMC1_PUSTRENGTH_GRP_i (where $i = 1$ to 3) control bits are added in the [CONTROL_MMC1](#) register to program the pullup strength for the MMC/SD/SDIO1 I/Os group.

- [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), describes the different interfaces that have the pullup strength control and the pad corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics* section of the device data manual provides more information about the specific pullup strength settings applicable to these interfaces multiplexed to I/O pads with configurable pullup strength.

18.4.12.9.8 I2Cx I/Os Group Pullupresx Controls and Load Range Settings

The I2Cx buffer contains internal pullup resistors for both F/S and HS modes. LB[1:0] bits are used to select an appropriate pullup resistor for a given load range.

The active high GLFENB[0] bit is implemented for I²C receivers to enable glitch-free operation.

NOTE: The pullup versus load settings applicable to I2Cx FS mode also apply to I2Cx standard speed mode.

The type of pullup resistor (external or internal) for a certain I2Cx I/O group (where $x = 1$ to 4) is selected through the I2Cx_SCL_PULLUPRESX and I2Cx_SDA_PULLUPRESX bits which reside in the [CONTROL_I2C_0](#) register. The SR_SCL_PULLUPRESX and SR_SDA_PULLUPRESX bits reside in the [CONTROL_I2C_2](#) register, which is part of the wakeup voltage domain.

Internal pullups are activated when I2Cx_SCL_PULLUPRESX/I2Cx_SDA_PULLUPRESX = 0b0 or SR_SCL_PULLUPRESX/SR_SDA_PULLUPRESX = 0b0.

I²C functionality is not ensured if the weak internal pullup or pulldown is activated on any of the I/Os connected to the bus.

NOTE: The user must set PULLUDENABLE = 0b0 in the I2Cx padconf registers (disable internal weak pullup resistors on i2cx pads) to ensure the full I/O cell performance capabilities of the I²C.

The I²C pads require different LB[1:0] and GLFENB[0] bit field settings to achieve optimal electrical performance for the multiplexed (in MuxMode = 0x0) I²C signals. This behavior may depend on various factors:

- [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), describes the I²C pads and their corresponding software control registers.
- The *Electrical Characteristics/DC Electrical Characteristics/I²C DC Electrical Characteristics* section of the device data manual provides more information about the specific LB[1:0] and GLFENB[0] bit settings applicable to I²C I/O pads.

18.4.12.9.9 Device Interfaces Signal Group Controls Mapping

[Table 18-75](#) through [Table 18-102](#) describe the mapping of the different signal integrity control bit fields in the different signal integrity control registers described in [Table 18-68](#).

NOTE: The same I/O cell and I/O cell controls assigned to pad signal available when Muxmode = 0 are shared between signals available on the same pad when Muxmode is selected different than 0. For more information, see [Section 18.4.8.3, Pad Multiplexing Register Fields](#).

18.4.12.10 Dual Voltage-Supplied Peripheral Controls

Some of the peripheral I/Os have the option to be supplied with a 1.2-V or 1.8-V power supply (VDD5 through device external pads). The power supply level to the dual-voltage I/Os of different peripherals is configurable through bit fields in the [CONTROL_CORE_PADCONF_MODE](#) register in the CORE power domain (EMIF, GPMC, CAMERA, SDMMC2 I/Os) and the [CONTROL_WKUP_PADCONF_MODE](#) register in the WKUP power domain (EMIF and FREF generator). One control bit in these registers is dedicated to set dual voltage per group of pads.

NOTE: Dynamic switching between 1.2-V and 1.8-V voltage modes on dual-voltage peripheral I/Os is not allowed.

[Table 18-103](#) describes dual-voltage controls versus the mapping of different pads.

Table 18-103. Dual-Voltage Peripheral Control Bits vs Pad Mapping

| Dual-Voltage VDDS = 1.2-V/1.8-V Control Bits | Pads With Dual-Voltage Settings |

18.5 Control Module Programming Guide

18.5.1 Control Module Low-Level Programming Models

This section covers the low-level programming sequences for configuration and use of the control module.

18.5.1.1 Global Initialization

18.5.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the control module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the environment and integration of the control module. For more information, see [Section 18.2](#), *Control Module Environment*, and [Section 18.3](#), *Control Module Integration*.

Table 18-104. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRCM | The two clocks, CFG_L4_ICLK and WKUP_L4_ICLK2, coming from the PRCM module are not software-controlled by the module. For more information about the two clocks, see Section 3.6.3.2.4 , <i>CM2 Clock Generator</i> , and Section 3.6.3.1 , <i>PRM Clock Source</i> , in Chapter 3 , <i>Power, Reset, and Clock Management</i> . |
| L4 interconnect | For information about the L4_CFG interconnect configuration, see Section 13.3 , <i>L4 Interconnects</i> , in Chapter 13 , <i>Interconnects</i> . |

18.5.1.1.2 Control Module Global Initialization

18.5.1.1.2.1 Software Reset

The control module is not sensitive to a software reset.

18.5.1.1.2.2 Clock Gating Configuraton

As described in [Section 18.4.2](#), *Control Module Clock Configuration*, the programmer can choose clock-gating strategy individually for each of the four control module instances. [Table 18-105](#) explains the necessary steps.

Table 18-105. Configure Clock Gating for Different Control Module Instances

| Step | Register/Bit Field/Programming Model | Value |
|----------------------------------------------|-----------------------------------------------------|-------|
| 1. Set clock gating for SYCTRL_PADCONF_CORE. | CONTROL_PADCONF_CORE_SYSCONFIG[3:2] | 0x- |
| 2. Set clock gating for SYCTRL_PADCONF_WKUP. | CONTROL_PADCONF_WKUP_SYSCONFIG[3:2] | 0x- |
| 3. Set clock gating for SYCTRL_GENERAL_CORE. | CONTROL_GEN_CORE_SYSCONFIG[3:2] | 0x- |
| 4. Set clock gating for SYCTRL_GENERAL_WKUP. | CONTROL_GEN_WKUP_SYSCONFIG[3:2] | 0x- |

18.5.1.2 Operational Modes Configuration

18.5.1.2.1 Video Driver Configuration

This section gives information about all modules and features in the high-tier device.

For more information about video digital-to-analog (DAC), see [Section 10.6](#), *Video Encoder*. [Table 18-106](#) lists the steps to configure the control module AVDAC.

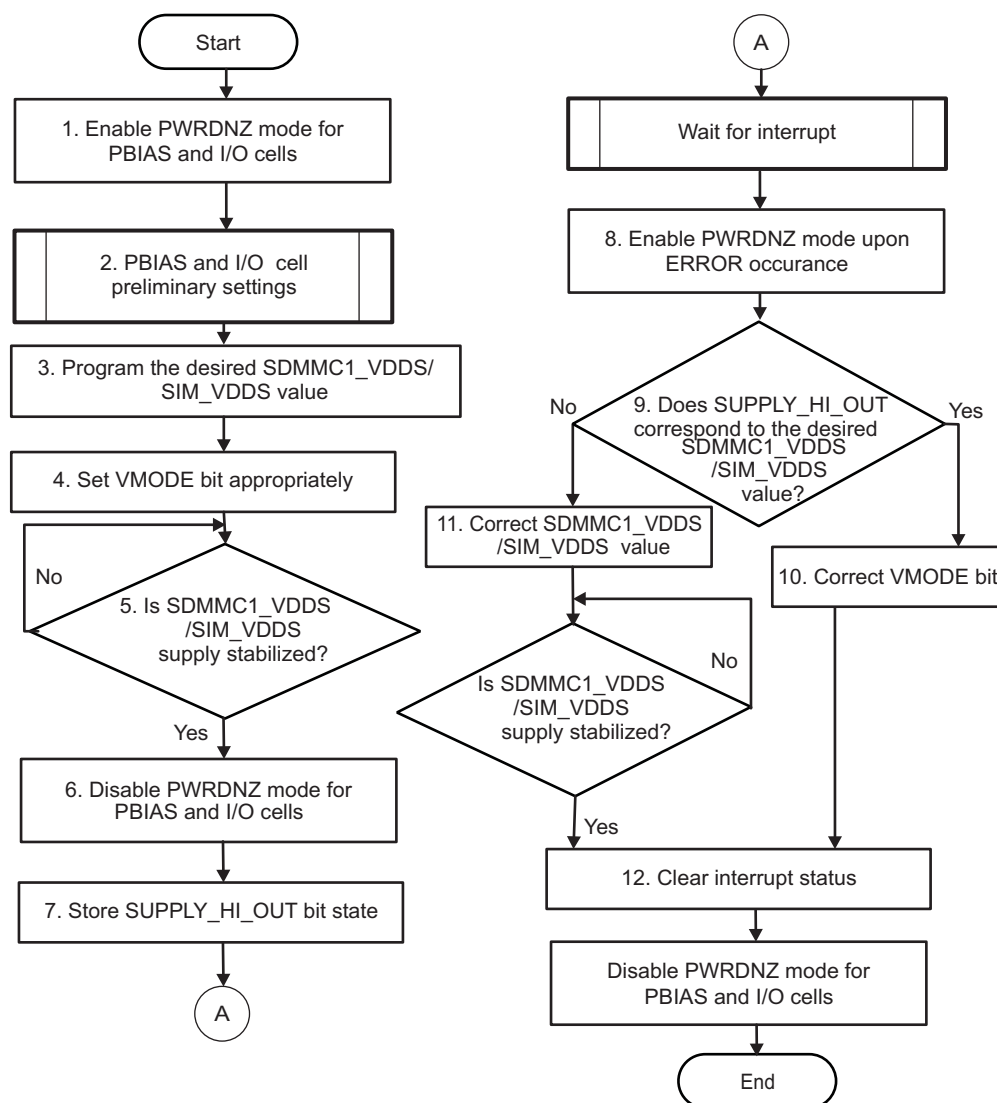

Table 18-106. Control Module AVDAC Configuration

| Step | Register/Bit Field/Programming Model | Value |
|----------------------------------------------|--------------------------------------|-------|
| 1. Video buffer is bypassed/not bypassed. | CONTROL_AVDAC[30] AVDAC_TVOUTBYPASS | 0b- |
| 2. Enable/disable ac coupling for TV output. | CONTROL_AVDAC[31] AVDAC_ACEN | 0b- |

18.5.1.2.2 Extended-Drain I/Os and PBIAS Cells Programming Guide

This section describes the programming flow to go from 3.0 V to 1.8 V, and vice versa, when operating with the extended-drain I/Os and PBIAS cells. Figure 18-20 shows the configuration of the PBIAS cell to operate in different modes (interrupt method).

Table 18-107 provides the register settings for configuring the MMC1_PBIAS and MMC1 I/O cells, and Table 18-108 provides the register settings for configuring the PBIAS1 cell, USBC1_ICUSB cell, and gpio_wk0gpio_wk2 associated I/O cells.

Figure 18-20. Configuring PBIAS Cell to Operate in Different Modes, Interrupt Method

sysctrl-021

Table 18-107. Register Settings for Configuring the MMC1_PBIAS and MMC1 I/O Cells

| Procedure Name | Description | Register Settings |
|-------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Enable PWRDNZ mode for MMC1_PBIAS cell, and MMC/SD/SDIO1 I/O cell. | Software must keep MMC1_PBIAS cell and MMC1_I/O cell PWRDNZ signals low whenever SDMMC1_VDDS ramps up/down or changes. This is for cell protection purposes. | 1. Set CONTROL_PBIASLITE [22] MMC1_PBIASLITE_PWRDNZ = 0b0. 2. Set CONTROL_PBIASLITE [26] MMC1_PWRDNZ = 0b0. |
| 2. Preliminary MMC1_PBIAS and MMC1 I/O cell settings | Enable MMC1_PBIAS cell output and MMC1_PBIAS error associated interrupt. Select desired I/Os within the MMC1 I/O cell and set their corresponding pad configuration fields appropriately. Set the group speed and pullup strength controls for the MMC/SD/SDIO1 pads. | 1. Set CONTROL_PBIASLITE [25] MMC1_PBIASLITE_HIZ_MODE = 0b0. 2. See Chapter 17, Interrupt Controller , for more information about setting MA_IRQ_75 line associated interrupt request PBIAS_IRQ. 3. For I/O multiplexing and pad configuration settings, see Section 18.5.1.2.5, Pad Configuration Programming Points . 4. Set the speed control bits for the MMC1 I/O cell pads: <ul style="list-style-type: none"> • CONTROL_MMC1[27] SDMMC1_DR0_SPEEDCTRL = 0b- • CONTROL_MMC1[26] SDMMC1_DR1_SPEEDCTRL = 0b- • CONTROL_MMC1[28] SDMMC1_DR2_SPEEDCTRL = 0b- 5. Set the pullup strength control bits for the MMC1 I/O cell pad groups: <ul style="list-style-type: none"> • CONTROL_MMC1[31] SDMMC1_PUSTRENGTH_GRP0=0b- • CONTROL_MMC1[30] SDMMC1_PUSTRENGTH_GRP1=0b- • CONTROL_MMC1[29] SDMMC1_PUSTRENGTH_GRP2=0b- • CONTROL_MMC1[28] SDMMC1_PUSTRENGTH_GRP3=0b- |
| 3. Program the desired SDMMC1_VDDS voltage for MMC/SD/SDIO1 I/Os. | Program external power supply IC to generate appropriate SDMMC1_VDDS voltage: 3.0 V/1.8 V). | For more information about I ² C interface operation, see Section 23.1, Multimaster High-Speed I²C . |
| 4. Set VMODE bit appropriately. | PBIAS voltage generation is based on the value of VMODE, set according to externally applied SDMMC1_VDDS voltage. | Set CONTROL_PBIASLITE [21] MMC1_PBIASLITE_VMODE = 0b- ⁽¹⁾ |
| 5. Check if SDMMC1_VDDS supply is stabilized? | Check the state of the externally generated SDMMC1_VDDS voltage, which is provided through communication between the device and external power supply device over the I ² C interface. | For more information about I ² C interface settings, see Section 23.1, Multimaster High-Speed I²C . |
| 6. Disable PWRDNZ (power down) mode for MMC1_PBIAS and associated extended-drain MMC1 I/O cell. | This starts up the MMC1_PBIAS cell work to generate the PBIAS voltage. | 1. Set CONTROL_PBIASLITE [22] MMC1_PBIASLITE_PWRDNZ = 0b1. 2. Set CONTROL_PBIASLITE [26] MMC1_PWRDNZ = 0b1. |
| 7. Store SUPPLY_HI_OUT bit state. | Done as a preliminary step for error-handling analysis. (Whenever PWRDNZ = 0b0, SUPPLY_HI_OUT is unconditionally set to 0b0.) | Store CONTROL_PBIASLITE [24] MMC1_PBIASLITE_SUPPLY_HI_OUT bit in memory. |
| 8. Enable PWRDNZ mode upon error occurrence. | It is recommended that all the I/Os are powered down (PWRDNZ = 0) as soon as VMODE_ERROR is high. | 1. Set CONTROL_PBIASLITE [26] MMC1_PWRDNZ = 0b0 . 2. Set CONTROL_PBIASLITE [22]MMC1_PBIASLITE_PWRDNZ = 0b0. |
| 9. Does SUPPLY_HI_OUT correspond to the desired SDMMC1_VDDS? | Test if error comes from incorrectly set SDMMC1_VDDS value or incorrectly set VMODE bit. | Check the SUPPLY_HI_OUT bit stored in memory. |
| 10. Correct VMODE bit | If SUPPLY_HI_OUT level corresponds to desired SDMMC1_VDDS value, then correct the value of the VMODE bit. | Modify the value of the CONTROL_PBIASLITE [21] MMC1_PBIASLITE_VMODE bit. |
| 11. Correct SDMMC1_VDDS value. | If SUPPLY_HI_OUT is different from expected, correct and set SDMMC1_VDDS value over I ² C again. | For more information about I ² C interface settings, see Section 23.1, Multimaster High-Speed I²C . |
| 12. Clear Interrupt status. | Clear the IRQ_MA_75 interrupt status flag. | For more information about setting the MA_IRQ_75 line associated interrupt request PBIAS_IRQ, see Chapter 17, Interrupt Controller . |

⁽¹⁾ Must be set high when external MMC1_VDDS source programmed to be 3.0 V, or low when external MMC1_VDDS source programmed to be 1.8 V. Reset default value corresponds to 3.0 V.

Table 18-108. Register Settings for Configuring the PBIAS1 Cell, USBC1_ICUSB, and gpio_wk0gpio_wk2 Associated I/O Cells

| Procedure Name | Description | Register Settings |
|------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Enable PWRDNZ mode for the PBIAS1 cell USBC1_ICUSB I/O cell, and gpio_wk0–gpio_wk2 associated I/O cells. | Software must keep PBIAS1 cell and the associated USBC1_ICUSB and gpio_wk0gpio_wk2 I/O cells PWRDNZ signals low whenever SIM_VDDS is ramps up/down or changes. This is for cell protection purposes. | <ol style="list-style-type: none"> 1. Set CONTROL_PBIASLITE[28] PBIASLITE1_PWRDNZ = 0b0. 2. Set CONTROL_PBIASLITE[20] USBC1_ICUSB_PWRDNZ = 0b0. 3. Set CONTROL_GPIOWK[28] GPIOWK_IO_PWRDNZ = 0b0. |
| 2. Preliminary PBIAS1 cell, USBC1_ICUSB, and gpio_wk0–gpio_wk2 cell settings | Enable PBIAS1 cell output and USBC1_ICUSB and gpio_wk0–gpio_wk2 error associated interrupt. Select desired I/Os within the USBC1_ICUSB and GPIOWK I/O cells and set their corresponding pad configuration fields appropriately. Set the speed and pulldown controls for the pads (if applicable). | <ol style="list-style-type: none"> 1. Set CONTROL_PBIASLITE[31] PBIASLITE1_HIZ_MODE = 0b0. 2. See Chapter 17, Interrupt Controller, for more information about setting MA_IRQ_75 line associated interrupt request PBIAS_IRQ. 3. For I/O multiplexing and pad configuration settings, see Section 18.5.1.2.5, Pad Configuration Programming Points. 4. Set the speed control bits for USBC1_ICUSB I/O cell pads CONTROL_MMC1[24] USBC1_DR0_SPEEDCTRL = 0b- (No speedctrl available for GPIOWK associated I/O cell). 5. Disable strong pulldowns on the gpio_wk1 and gpio_wk2 pads available by default after reset: <ul style="list-style-type: none"> • CONTROL_GPIOWK[31] PAD_GPIO_WK1_LOW = 0b0 • CONTROL_GPIOWK[29] PAD_GPIO_WK2_LOW = 0b0 |
| 3. Program the desired SIM_VDDS voltage for the USBC1_ICUSB/gpio_wk0–gpio_wk2 or(hw_dbg1–hw_dbg3 in WKUP domain) I/Os. | Program external power supply IC to generate appropriate SIM_VDDS voltage: 3.0 V/1.8 V | For more information about I ² C interface operation, see Section 23.1, Multimaster High-Speed I²C |
| 4. Set VMODE bit appropriately. | PBIAS voltage generation is based on the value of VMODE, set according to externally applied SIM_VDDS voltage. | Set CONTROL_PBIASLITE [27] PBIASLITE1_VMODE = 0b-. ⁽¹⁾ |
| 5. Check if SIM_VDDS supply is stabilized? | Check the state of the externally generated SIM_VDDS voltage. This is provided through communication between device and companion power supply device over the I ² C interface. | For more information about I ² C interface settings, see Section 23.1, Multimaster High-Speed I²C , |
| 6. Disable PWRDNZ mode for PBIAS1 cell and its associated extended-drain USBC1_ICUSB and gpio_wk0–gpio_wk2 I/O cells. | This starts up the the PBIAS1 cell work to generate the PBIAS voltage. | <ol style="list-style-type: none"> 1. Set CONTROL_PBIASLITE[28] PBIASLITE1_PWRDNZ = 0b1. 2. Set CONTROL_PBIASLITE[20] USBC1_ICUSB_PWRDNZ = 0b1. 3. Set CONTROL_GPIOWK[28] GPIOWK_IO_PWRDNZ = 0b1. |
| 7. Store SUPPLY_HI_OUT bit state. | Done as a preliminary step for error-handling analysis. (Whenever PWRDNZ = 0b0, SUPPLY_HI_OUT is unconditionally set to 0b0.) | Store the CONTROL_PBIASLITE [30] PBIASLITE1_SUPPLY_HI_OUT bit in memory. |
| 8 .Enable PWRDNZ mode upon error occurrence. | It is recommended that all the I/Os are powered down (PWRDNZ = 0) as soon as VMODE_ERROR is high. | <ol style="list-style-type: none"> 1. Set CONTROL_PBIASLITE[28] PBIASLITE1_PWRDNZ = 0b0. 2. Set CONTROL_PBIASLITE[20] USBC1_ICUSB_PWRDNZ = 0b0. 3. Set CONTROL_GPIOWK[28] GPIOWK_IO_PWRDNZ = 0b0. |
| 9. Does SUPPLY_HI_OUT correspond to the desired SIM_VDDS level? | Test if error comes from incorrectly set SIM_VDDS value or incorrectly set VMODE bit. | Check the SUPPLY_HI_OUT bit stored in memory. |
| 10. Correct VMODE bit. | If SUPPLY_HI_OUT level corresponds to desired SIM_VDDS value, then correct the value of the VMODE bit. | Modify the value of the CONTROL_PBIASLITE [27] PBIASLITE1_VMODE bit. |
| 11. Correct SIM_VDDS value. | If SUPPLY_HI_OUT is different than expected, correct and set SIM_VDDS value over I ² C again. | For more information about I ² C interface settings, see Section 23.1, Multimaster High-Speed I²C . |
| 12. Clear interrupt status. | Clear the IRQ_MA_75 interrupt status flag. | For more information about setting the MA_IRQ_75 line associated interrupt request PBIAS_IRQ, see Chapter 17, Interrupt Controller . |

⁽¹⁾ Must be set high when external SIM_VDDS source programmed to be 3.0 V, or low when external SIM_VDDS source programmed to be 1.8 V. Reset default value corresponds to 3.0 V. Reset default value corresponds to 3.0 V.

18.5.1.2.3 Hardware Observability Settings

This section describes the procedures to control hardware observability features of the device. To configure hardware observability feature, the programmer must perform the steps listed in [Table 18-109](#).

Table 18-109. Configure Hardware Observability Features

| Step | Register/Bit Field/Programming Model | Value |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| 1. Select hwobs(0) signal frequency divider value (applies only to po_hw_dbg0 bus signal propagated in the CORE power domain). | CONTROL_HWOBS_CONTROL [7:3] HWOBS_CLKDIV_SEL | 0x- ⁽¹⁾ |
| 2. Enable/disable hwobs gating and alternatively set all hwobs ports to 0 or 1. | 1. CONTROL_HWOBS_CONTROL [2] HWOBS_ALL_ZERO_MODE 2. CONTROL_HWOBS_CONTROL [1] HWOBS_ALL_ONE_MODE | 0x- ⁽²⁾ |
| 3. Enable/disable hwobs port gating only for signals coming from IPs identified in the MACRO group (applies only to po_hw_dbg bus signals propagated in the CORE power domain). | CONTROL_HWOBS_CONTROL [0] HWOBS_MACRO_ENABLE | 0x- ⁽³⁾ |
| 4. Associate a certain hwobs channel to the CORE or WKUP power domain. | Configure each bit from the CONTROL_DEBOBS_FINAL_MUX_SEL [31:0] SELECT bit field appropriately for its corresponding hw_dbg channel. | 0x- |
| 5. Choose the source of a signal or signal view channel in the CORE power domain. | Configure each of the bit fields CONTROL_CORE_CONF_DEBUG_SEL_TST_0 [3:0] MODE through CONTROL_CORE_CONF_DEBUG_SEL_TST_31 [3:0] MODE appropriately for its corresponding hw_dbg channel. | 0x- |
| 6. Choose the source of a signal within the WKUP power domain. | Configure each bit CONTROL_WKUP_CONF_DEBUG_SEL_TST_i [0] MODE, (where i =0 to 31) appropriately for its corresponding hw_dbg channel i (where i = 0 to 31). | 0x- |
| 7. Choose to associate a certain DPLL signal to a given DPLL signal view channel (applies only to po_hw_dbg bus signals propagated in the CORE power domain). | 1. CONTROL_CONF_DPLL_FREQLOCK_SEL [2:0] MULT 2. CONTROL_CONF_DPLL_TINITZ_SEL [2:0] MULT 3. CONTROL_CONF_DPLL_PHASELOCK_SEL [2:0] MULT 4. CONTROL_CONF_DPLL_TENABLE_SEL [2:0] MULT 5. CONTROL_CONF_DPLL_TENABLEDIV_SEL [2:0] MULT 6. CONTROL_CONF_DPLL_BYPASSACK_SEL [2:0] MULT 7. CONTROL_CONF_DPLL_IDLE_SEL [2:0] MULT | 0x- |
| 9. Choose to associate a certain clockout signal to a given clockview channel (applies only to po_hw_dbg bus signals propagated in the CORE power domain). | CONTROL_CONF_CLK_SEL0 [2:0] MULT through CONTROL_CONF_CLK_SEL2 [2:0] MULT | 0x- |
| 10. Choose to associate an sDMA signal to a given sDMA view channel (applies only to po_hw_dbg bus signals propagated in the CORE power domain). | CONTROL_CONF_SDMA_REQ_SEL0 [6:0] MULT through CONTROL_CONF_SDMA_REQ_SEL3 [6:0] MULT | 0x- |
| 11. Set the appropriate pad configuration bit fields to associate hw_dbgn pad function to output pins and configure additional output pad features. | For more information, see Section 18.4.11, Hardware Observability , and Section 18.4.8, Pad Functional Multiplexing and Configuration . | See Section 18.4.8, PAD Functional Multiplexing and Configuration , for more information |

⁽¹⁾ To configure the hwobs(0) channel to operate normally, the value of the HWOBS_CLKDIV_SEL bit must be set different from 0.

⁽²⁾ Set both bits to 0 to enable hardware observability. Set only one of them to 1 to gate hwobs ports according to output state required.

⁽³⁾ The modules which belong to this group are: Cortex-A9 MPU subsystem, DSP subsystem, IVA-HD, display subsystem, CM2, and ABE.

For more information about different functionalities and registers associated with the hardware observability features, see [Section 18.4.11, Hardware Observability](#).

18.5.1.2.4 Off Mode Preliminary Settings

This section describes configurations of pads to work in off mode. [Table 18-110](#) lists the actions that must be performed once, and remain valid for all device OFF <-> ON transitions.

Table 18-110. Setting Pads Off Mode Through Padconfiguration Registers

| Step | Register/Bit Field/Programming Model | Value |
|--------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1. Set the OFFMODEPULLTYPESELECT bit. | CONTROL_CORE_PAD0_X_PAD1_Y[29,13]: Select pullup/down type when pad in off mode. | 0b- |
| 2. Set the OFFMODEPULLUDENABLE bit. | CONTROL_CORE_PAD0_X_PAD1_Y[28,12]: Enable/disable pullup/down feature when pad in off mode. | 0b- |
| 3. Set the OFFMODEOUTVALUE bit. | CONTROL_CORE_PAD0_X_PAD1_Y[27,11]: Set off mode pad override value. | 0b- |
| 4. Set the OFFMODEENABLE bit (enable/disable pad overriding capability in off mode). | CONTROL_CORE_PAD0_X_PAD1_Y[25,9]: Set pad to keep its previous state (it had before going to off mode) or force pad output to a certain override value (OFFMODEOUTVALUE) when pad in off mode. | 0b- |
| 5. Set the OFFMODEOUTENABLE bit. | CONTROL_CORE_PAD0_X_PAD1_Y[26,10]: Enable/disable output in off mode. | 0b- |
| 6. Program a valid device ACTIVE pads configuration. | See Table 18-111 for more information about ACTIVE pads configuration. | |
| 7. Set the clock-gating strategy. | 1. CONTROL_PADCONF_CORE_SYSCONFIG [3:2] IP_SYSCONFIG 2. CONTROL_PADCONF_WKUP_SYSCONFIG [3:2] IP_SYSCONFIG | 0x2 ,0x3 |
| 8. Enable/disable the wake-up detection capability. ⁽¹⁾ | CONTROL_CORE_PAD0_X_PAD1_Y[30,14] | 0b- |

⁽¹⁾ When the wake-up detection is enabled for a pad, this pad is configured as input. Therefore, do not forget to write 0b1 in the OFFOUTENABLE bit to disable the output capability.

18.5.1.2.5 Pad Configuration Programming Points

This section describes through an example the configurations of pads necessary for working in active mode.

To configure the pad, ensure that the following steps are done:

1. Identify signals required on the interface based on the target application.

Example: To configure the UART2 interface on balls, the required signals are `uart2_tx`, `uart2_rts`, `uart2_cts`, and `uart2_rx`.

2. Choose the pads used for those signals. Some signals may be available on several pads and/or may be multiplexed with other signals needed for another application. See [Section 18.4.8.3, Pad Multiplexing Register Fields](#).

Example: Unlike the UART2 interface signals, `uart2_rx` and `uart2_tx`, each of which is available on two pads, the `uart2_cts` and `uart2_rts` signals are available on only one pad each (MUXMODE = 0b000). However, `uart2_cts` is multiplexed with the MMC I/O signal `sdmmc3_clk` and `uart2_rts` is multiplexed with the MMC I/O signal `sdmmc3_cmd` on the same pad. Assume that the MMC I/O 3 interface is also required in the system. Therefore, for the MMC I/O interface signals, pads must be used where those signals are not multiplexed with a UART2 signal if possible. In this case the solution is to use `sdmmc3_clk` and `sdmmc3_cmd` on another two pads of the device (`usbb2_ulpitll_dat7` and `usbb2_ulpitll_dat6`) configuring MUXMODE = 0b010.

3. Identify the signal integrity parameter settings (drive strength, impedance, slew rate, pullup/down strength, etc.) necessary for the I/O cells associated with the pad (see [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#)).

For the register settings of the signal integrity parameters for the `uart2_rx`, `uart2_tx`, `uart2_cts`, and `uart2_rts` pads (this is the variant when the desired `uart2` signals appear in MuxMode = 0x0), see [Table 18-91](#).

For the `uart2_cts`, `uart2_rts`, and `uart2_rx` pads, the following bit fields (Mode and Load bit group settings) must be set:

- [CONTROL_SMART3IO_PADCONF_1](#)[27:26] UART2_DR0_MB
- [CONTROL_SMART3IO_PADCONF_2](#) [13] UART2_DR0_LB

For the `uart2_tx` pad, the following bit fields (Mode and Load bit group settings) must be set:

- [CONTROL_SMART3IO_PADCONF_1](#) [25:24] UART2_DR1_MB
- [CONTROL_SMART3IO_PADCONF_2](#) [12] UART2_DR1_LB

For recommendations about the signal integrity parameter settings of the mentioned pad group, see the device data manual.

NOTE: To identify the signal-associated I/O cell signal parameter settings in [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), the user must search for the device pad name on which the desired signal is muxed, because the I/O cell settings are designated and listed on a per-pad basis. This means that a signal name does not appear (unless MuxMode = 0x0) in [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#), but only the pad on which the signal is muxed.

Pads that do not have software I/O cell signal integrity parameter controls are not listed in [Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping](#).

Assume the user application configures the `sdmmc3_clk` and `sdmmc3_cmd` signals on the `usbb2_ulpitll_dat7` and `usbb2_ulpitll_dat6` pads (MuxMode = 0x2). The I/O cell setting (single-bit group control – SPI3_DR0_DS of driver output impedance) listed in [Table 18-79](#) also applies to the `sdmmc3_clk` and `sdmmc3_cmd` signals, which appear on the same pads, when MuxMode = 0x2.

In this case, the [CONTROL_SMART2IO_PADCONF_2](#)[21] SPI3_DR0_DS bit must be set to configure the I/O cell performance of `sdmmc3_clk` and `sdmmc3_cmd`.

For recommendations about the signal integrity parameter settings of the mentioned pad group, see the device data manual.

4. Identify and program the peripheral dual-voltage settings, if they apply to the chosen pads.

[Table 18-103](#) lists the corresponding control bits of the pads in the [CONTROL_CORE_PADCONF_MODE](#) and [CONTROL_WKUP_PADCONF_MODE](#) registers. The identification of the I/O dual-voltage domains/control bits for a signal must be made on a per-pad basis.

All pads (`uart2_cts`, `uart2_rts`, `uart2_rx`, and `uart2_tx`) fall within the same dual-voltage domain (VDDS_DV_BANK1), and the I/O supply voltage (1.2 V/1.8 V) is configured by setting the [CONTROL_CORE_PADCONF_MODE](#)[30] VDDS_DV_BANK1 bit.

As previously explained, the `sdmmc3_clk` and `sdmmc3_cmd` signals are muxed on the `usbb2_ulpitll_dat7` and `usbb2_ulpitll_dat6` pads. The dual-voltage control bit corresponding to these two pads is [CONTROL_CORE_PADCONF_MODE](#)[26] VDDS_DV_BANK6 (see [Table 18-103](#)).

For more information about pad performance dependencies from I/O dual-voltage supply settings, see the device data manual.

5. Identify the pad configuration registers associated with the pads to be used in the application. See [Section 18.4.8.3, Pad Multiplexing Register Fields](#).

Example: Under the previous hypothesis, the pad configuration registers to program are:

- `uart2_rts`: [CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS](#)[31:16]
- `uart2_cts`: [CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS](#)[15:0]
- `uart2_tx`: [CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX](#)[31:16]
- `uart2_rx`: [CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX](#)[15:0]
- `sdmmc3_clk` (MuxMode = 0x2): [CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1_USBB2_ULPITLL_DAT7](#)[31:16]
- `sdmmc3_cmd` (MuxMode = 0x2): [CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1_USBB2_ULPITLL_DAT7](#)[15:0]

Table 18-111. ACTIVE PADS Configuration Points

| Step | Register/Bit Field/Programming Model | Value |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| 1. Identify the interface signals and map them to the appropriate pads according to the application requirements and the device-specific pad I/O muxing capabilities. See Section 18.4.8.3, Pad Multiplexing Register Fields . | Define the list of I/O signal names: uart2_cts, uart2_rts, uart2_rx, uart2_tx, sdmmc3_clk, and sdmmc3_cmd Define the list of corresponding pads: uart2_cts, uart2_rts, uart2_rx, uart2_tx, usbb2_ulpitll_dat7, and usbb2_ulpitll_dat6 | – |
| 2. Identify the corresponding I/O cell signal integrity parameter controls for the pad (on a per-pad basis). See Section 18.4.12.9.9, Device Interfaces Signal Group Controls Mapping . | (uart2_cts, uart2_rts, uart2_rx pads) CONTROL_SMART3IO_PADCONF_1 [27:26] UART2_DR0_MB CONTROL_SMART3IO_PADCONF_2 [13] UART2_DR0_LB uart2_tx pad) CONTROL_SMART3IO_PADCONF_1 [25:24] UART2_DR1_MB CONTROL_SMART3IO_PADCONF_2 [12] UART2_DR1_LB (usbb2_ulpitll_dat7, usbb2_ulpitll_dat6) CONTROL_SMART2IO_PADCONF_2 [21] SPI3_DR0_DS | For more information about the recommended I/O settings, see the device data manual. |
| 3. Determine whether the pad is associated with a peripheral dual-voltage domain (see the device data manual). Identify its corresponding 1.2-V/1.8-V dual-voltage control bit in the CONTROL_CORE_PADCONF_MODE or CONTROL_WKUP_PADCONF_MODE register. See Table 18-103 . | (uart2_cts, uart2_rts, uart2_rx, uart2_tx) CONTROL_CORE_PADCONF_MODE [30] VDDS_DV_BANK1 (usbb2_ulpitll_dat7, usbb2_ulpitll_dat6) CONTROL_CORE_PADCONF_MODE [26] VDDS_DV_BANK6 | For more information about the I/O performance dependency on dual-voltage settings, see the device data manual. |
| 4.. Configure MUXMODE field in pad configuration registers associated with the pads used. | CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS [18:16] UART2_RTS_MUXMODE CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS [2:0] UART2_CTS_MUXMODE CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX [18:16] UART2_TX_MUXMODE CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX [2:0] UART2_RX_MUXMODE CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1_USBB2_ULPITLL_DAT7 [18:16] USBB2_ULPITLL_DAT7_MUXMODE CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1_USBB2_ULPITLL_DAT7 [2:0] USBB2_ULPITLL_DAT6_MUXMODE | 0b000 0b000 0b000 0b000 0b010 0b010 |
| 5.. Select the type of the internal pullup/down resistor ⁽¹⁾ . | CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX [4] UART2_RX_PULLTYPESELECT CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS [2:0] UART2_CTS_PULLTYPESELECT | 0b1 (pullup selected) 0b1 (pullup selected) |
| 6.. Enable/disable pullup/down feature of the pad ⁽²⁾ . | CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX [3] UART2_RX_PULLUDENABLE CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS [3] UART2_CTS_PULLUDENABLE | 0b1 (pull feature enabled) 0b1 (pull feature enabled) |

(1) It is recommended to use internal pullup/down resistor if pad is used as input and external pullup/down is not used.

(2) If the pad is configured in output mode, it is recommended for software to disable the internal pullup/pulldown associated with it.

Table 18-111. ACTIVE PADS Configuration Points (continued)

| Step | Register/Bit Field/Programming Model | Value |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|------------------|
| 7. Set the direction of the pin signal. ⁽²⁾ | CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX[8] UART2_RX_INPUTENABLE | 0b1 (input pin) |
| | CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS[8] UART2_CTS_INPUTENABLE | 0b1 (input pin) |
| | CONTROL_CORE_PAD0_UART2_RX_PAD1_UART2_TX[24] UART2_TX_INPUTENABLE | 0b0 (output pin) |
| | CONTROL_CORE_PAD0_UART2_CTS_PAD1_UART2_RTS[24] UART2_RTS_INPUTENABLE | 0b0 (output pin) |
| | CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_ PAD1_USBB2_ULPITLL_DAT7[24] USBB2_ULPITLL_DAT7_INPUTENABLE (sdmmc3_clk) | 0b1 (input pin) |
| | CONTROL_CORE_PAD0_USBB2_ULPITLL_DAT6_PAD1 _USBB2_ULPITLL_DAT7[8] USBB2_ULPITLL_DAT6_INPUTENABLE (sdmmc3_cmd) | 0b1 (input pin) |

NOTE: The order for setting the previous pad configuration bits is not important.

NOTE: If a device pad is left unconnected, but power is supplied to the I/O, or the pad is used only as an output during the lifetime of the application, it is recommended to keep its corresponding padconfiguration bit CONTROL_CORE/WKUP_PAD0_X_PAD1_Y.INPUTENABLE set to 0b0. This keeps the input buffer disabled and reduces static current consumption.

NOTE: I/Os are non-failsafe, which means that voltage must never be applied at a pad before the internal I/O supply voltage VDDS is powered.

18.6 Control Module Register Manual

18.6.1 Control Module Instance Summary

Table 18-112 lists the base address and address space for the control module instances.

Table 18-112. Control Module Instance Summary

| Module instance | Base Address | Size | Description |
|--------------------------|--------------|------|-------------|
| SYSCTRL_GENERAL_C ORE | 0x4A00 2000 | 4KB | Module |
| SYSCTRL_GENERAL_W KUP | 0x4A30 C000 | 4KB | Module |
| SYSCTRL_PADCONF_C ORE | 0x4A10 0000 | 4KB | Module |
| SYSCTRL_PADCONF_W KUP | 0x4A31 E000 | 4KB | Module |

NOTE: All module registers are 8-, 16-, or 32-bit accessible through the L4 interconnect (little-endian encoding).

|-------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-------|
| 31:29 | EMIF1_SDRAM_TYPE | SDRAM type selection: Set to 0x4 for LPDDR2-S4. Set to 0x5 for LPDDR2-S2. All other values are reserved. | RW | 0x4 |
| 28:27 | EMIF1_SDRAM_IBANK_POS | Internal bank position: Set to 0x0 to assign internal bank address bits from the L3 address as shown in , <i>64-Byte Linear Read Starting at Address 0x0</i> , and , <i>64-Byte Linear Read Starting at Address 0x8 (LPDDR2-S2)</i> , in Chapter 15, Memory Subsystem . Set to 0x1, 0x2, or 0x3 to assign internal bank address bits from the L3 address as shown in , <i>64-Byte Linear Read Starting at Address 0x8 (LPDDR2-S4)</i> , , <i>64-Byte Linear Read Starting at Address 0x10</i> , and , <i>64-Byte Linear Read Starting at Address 0x18</i> , in Chapter 15, Memory Subsystem . | RW | 0x0 |
| 26:24 | RESERVED | | R | 0x0 |
| 23 | EMIF1_SDRAM_DDR2_DDQS | DDR2 differential DQS enable: Set to 0 for single ended DQS. Set to 1 for differential DQS. This bit is only for DDR2 mode; because the device supports LPDDR2, this bit is don't care. | RW | 0x1 |
| 22:21 | RESERVED | | R | 0x0 |
| 20 | EMIF1_SDRAM_DDR_DISABLE_DLL | Disable DLL select: Set to 0x0 to enable DLL inside SDRAM. Set to 0x1 to disable DLL inside SDRAM. | RW | 0x0 |
| 19:16 | RESERVED | | R | 0x0 |
| 15:14 | EMIF1_SDRAM_NARROW_MODE | SDRAM data bus width: Set to 0x0 for 64-bit width. Set to 0x1 for 32-bit width. Set to 0x2 for 16-bit width. All other values are reserved. | RW | 0x0 |

| Bits | Field Name | Description | Type | Reset |
|-------|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-------|
| 13:10 | EMIF1_SDRAM_CL | CAS latency (RL latency). The value of this field defines the CAS latency to be used when accessing connected SDRAM devices: Supported for LPDDR2-SDRAM: 0x3: CAS latency of 3 cycles 0x4: CAS latency of 4 cycles 0x5: CAS latency of 5 cycles 0x6: CAS latency of 6 cycles 0x7: CAS latency of 7 cycles 0x8: CAS latency of 8 cycles All other values are reserved. | RW | 0x3 |
| 9:7 | EMIF1_SDRAM_ROWSIZE | Row size. Defines the number of row address bits of connected SDRAM devices: Set to 0x0 for 9 row bits. Set to 0x1 for 10 row bits. Set to 0x2 for 11 row bits. Set to 0x3 for 12 row bits. Set to 0x4 for 13 row bits. Set to 0x5 for 14 row bits. Set to 0x6 for 15 row bits. Set to 0x7 for 16 row bits. This field is used only when the <code>ibank_pos</code> field in the SDRAM Config register is set to 0x1, 0x2, or 0x3. | RW | 0x4 |
| 6:4 | EMIF1_SDRAM_IBANK | Internal bank setup. Defines number of banks inside connected SDRAM devices: Set to 0x0 for 1 bank. Set to 0x1 for 2 banks. Set to 0x2 for 4 banks. Set to 0x3 for 8 banks. All other values are reserved. | RW | 0x3 |
| 3 | EMIF1_SDRAM_EBANK | External CS setup. Defines whether SDRAM accesses will use 1 or 2 CS lines. Set to 0 to use <code>pad_cs_o_n[0]</code> only: Set to 0x0 to use only <code>pad_cs_o_n[0]</code> . Set to 0x1 to use <code>pad_cs_o_n[1:0]</code> . This bit is automatically set to 0 if either the <code>cs0nvmen</code> or <code>cs1nvmen</code> field in the LPDDR2-NVM is set to 1. | RW | 0x0 |
| 2:0 | EMIF1_SDRAM_PAGESIZE | Page size. Defines the internal page size of the connected SDRAM devices: Set to 0x0 for 256-word page (8 column bits). Set to 0x1 for 512-word page (9 column bits). Set to 0x2 for 1024-word page (10 column bits). Set to 0x3 for 2048-word page (11 column bits). All other values are reserved. | RW | 0x0 |

| GPMC_NBE0_CLE_WAKEUPEVENT | GPMC_NBE0_CLE_WAKEUPENABLE | GPMC_NBE0_CLE_OFFMODEPULLTYPESELECT | GPMC_NBE0_CLE_OFFMODEPULLUDENENABLE | GPMC_NBE0_CLE_OFFMODEOUTVALUE | GPMC_NBE0_CLE_OFFMODEOUTENABLE | GPMC_NBE0_CLE_OFFMODEENABLE | GPMC_NBE0_CLE_INPUTENABLE | RESERVED | | | GPMC_NBE0_CLE_PULLTYPESELECT | GPMC_NBE0_CLE_PULLUDENENABLE | | | GPMC_NBE0_CLE_MUXMODE | GPMC_NWE_WAKEUPEVENT | GPMC_NWE_WAKEUPENABLE | GPMC_NWE_OFFMODEPULLTYPESELECT | GPMC_NWE_OFFMODEPULLUDENENABLE | GPMC_NWE_OFFMODEOUTVALUE | GPMC_NWE_OFFMODEOUTENABLE | GPMC_NWE_OFFMODEENABLE | GPMC_NWE_INPUTENABLE | RESERVED | | | GPMC_NWE_PULLTYPESELECT | GPMC_NWE_PULLUDENENABLE | | | GPMC_NWE_MUXMODE |

| Bits | Field Name | Description | Type | Reset |
|------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|------|-------|
| 31 | GPMC_NBE0_CLE_WAKEUPEV ENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 30 | GPMC_NBE0_CLE_WAKEUPEN ABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-------|
| 29 | GPMC_NBE0_CLE_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad gpmc_nbe0_cle 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 28 | GPMC_NBE0_CLE_OFFMODEPULLUDENAB LE | OffMode mode pullup/down enable for pad gpmc_nbe0_cle 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 27 | GPMC_NBE0_CLE_OFFMODE OUTVALUE | OffMode mode output value for pad gpmc_nbe0_cle 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 26 | GPMC_NBE0_CLE_OFFMODE OUTENABLE | OffMode mode output enable value for pad gpmc_nbe0_cle. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 25 | GPMC_NBE0_CLE_OFFMODEE NABLE | OffMode mode override control for pad gpmc_nbe0_cle 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 24 | GPMC_NBE0_CLE_INPUTENAB LE | Input enable value for pad gpmc_nbe0_cle 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 23:21 | RESERVED | | R | 0x0 |
| 20 | GPMC_NBE0_CLE_PULLTYPE SELECT | pullup/down selection for pad gpmc_nbe0_cle 0x0: pulldown selected 0x1: pullup selected | RW | 0 |
| 19 | GPMC_NBE0_CLE_PULLUDEN ABLE | pullup/down enable for pad gpmc_nbe0_cle 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 18:16 | GPMC_NBE0_CLE_MUXMODE | Functional multiplexing selection for pad gpmc_nbe0_cle 0x0: Select gpmc_nbe0_cle 0x1: Select dsi2_te0 0x3: Select gpio_59 | RW | 0x0 |
| 15 | GPMC_NWE_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 14 | GPMC_NWE_WAKEUPENAB LE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 13 | GPMC_NWE_OFFMODEPULLTYPE SELECT | OffMode mode pullup/down selection for pad gpmc_nwe 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 12 | GPMC_NWE_OFFMODEPULLUDEN ENABLE | OffMode mode pullup/down enable for pad gpmc_nwe 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 11 | GPMC_NWE_OFFMODEOUTVA LUE | OffMode mode output value for pad gpmc_nwe 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-------|
| 10 | GPMC_NWE_OFFMODEOUTENABLE | OffMode mode output enable value for pad gpmc_nwe. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 9 | GPMC_NWE_OFFMODEENABLE | OffMode mode override control for pad gpmc_nwe 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 8 | GPMC_NWE_INPUTENABLE | Input enable value for pad gpmc_nwe 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 7:5 | RESERVED | | R | 0x0 |
| 4 | GPMC_NWE_PULLTYPESELECT | pullup/down selection for pad gpmc_nwe 0x0: pulldown selected 0x1: pullup selected | RW | 1 |
| 3 | GPMC_NWE_PULLUDENABLE | pullup/down enable for pad gpmc_nwe 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 2:0 | GPMC_NWE_MUXMODE | Functional multiplexing selection for pad gpmc_nwe 0x0: Select gpmc_nwe 0x1: Select sdmmc2_cmd | RW | 0x0 |

⁽¹⁾ To ensure I/O safe operation at 1.8 V or 3.0 V and desired signal performance, the corresponding extended-drain I/O cell and PBIAS cell must be appropriately configured by software prior to signal selection on the pad, regardless of the signal multiplexing mode. For more details on extended-drain I/O cells and PBIAS cell descriptions and settings, see [Section 18.4.9, Extended-Drain I/O and PBIAS Cell](#), and [Section 18.5.1.2.2, Extended-Drain I/Os and PBIAS Cells Programming Guide](#).

| Bits | Field Name | Description | Type | Reset |
|------|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|------|-------|
| 31 | SDMMC5_DAT3_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 30 | SDMMC5_DAT3_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 29 | SDMMC5_DAT3_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad sdmmc5_dat3 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-------|
| 28 | SDMMC5_DAT3_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad sdmmc5_dat3 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 27 | SDMMC5_DAT3_OFFMODEOUTVALUE | OffMode mode output value for pad sdmmc5_dat3 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |
| 26 | SDMMC5_DAT3_OFFMODEOUTENABLE | OffMode mode output enable value for pad sdmmc5_dat3. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 25 | SDMMC5_DAT3_OFFMODEENABLE | OffMode mode override control for pad sdmmc5_dat3 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 24 | SDMMC5_DAT3_INPUTENABLE | Input enable value for pad sdmmc5_dat3 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 23:21 | RESERVED | | R | 0x0 |
| 20 | SDMMC5_DAT3_PULLTYPESELECT | pullup/down selection for pad sdmmc5_dat3 0x0: pulldown selected 0x1: pullup selected | RW | 1 |
| 19 | SDMMC5_DAT3_PULLUDENABLE | pullup/down enable for pad sdmmc5_dat3 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 18:16 | SDMMC5_DAT3_MUXMODE | Functional multiplexing selection for pad sdmmc5_dat3 0x0: Select sdmmc5_dat3 0x1: Select mcspi2_cs0 0x3: Select gpio_150 0x5: Select sdmmc2_dat3 0x7: Select safe_mode | RW | 0x7 |
| 15 | SDMMC5_DAT2_WAKEUPEVENT | Pad_x wake-up event status latched in the IO Read 0x0: No wake-up event occurred Read 0x1: A wake-up event occurred | R | 0 |
| 14 | SDMMC5_DAT2_WAKEUPENABLE | Input pad wake-up enable (and OFF mode input enable value) 0x0: wake-up detection is disabled 0x1: wake-up detection is enabled | RW | 0 |
| 13 | SDMMC5_DAT2_OFFMODEPULLTYPESELECT | OffMode mode pullup/down selection for pad sdmmc5_dat2 0x0: Offmode pulldown selected 0x1: Offmode pullup selected | RW | 0 |
| 12 | SDMMC5_DAT2_OFFMODEPULLUDENABLE | OffMode mode pullup/down enable for pad sdmmc5_dat2 0x0: Offmode pullup/down disabled 0x1: Offmode pullup/down enabled | RW | 0 |
| 11 | SDMMC5_DAT2_OFFMODEOUTVALUE | OffMode mode output value for pad sdmmc5_dat2 0x0: Set value at 0 0x1: Set value at 1 | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-------|
| 10 | SDMMC5_DAT2_OFFMODEOUTENABLE | OffMode mode output enable value for pad sdmmc5_dat2. This is an active low signal 0x0: Output enable 0x1: Output disable | RW | 0 |
| 9 | SDMMC5_DAT2_OFFMODEENABLE | OffMode mode override control for pad sdmmc5_dat2 0x0: I/O state keeps its previous state when OFF mode is active 0x1: I/O state is forced to OFF mode value when OFF mode is active | RW | 0 |
| 8 | SDMMC5_DAT2_INPUTENABLE | Input enable value for pad sdmmc5_dat2 0x0: Input buffer of I/O cell is disabled 0x1: Input buffer of I/O cell is enabled | RW | 1 |
| 7:5 | RESERVED | | R | 0x0 |
| 4 | SDMMC5_DAT2_PULLTYPESELECT | pullup/down selection for pad sdmmc5_dat2 0x0: pulldown selected 0x1: pullup selected | RW | 1 |
| 3 | SDMMC5_DAT2_PULLUDENABLE | pullup/down enable for pad sdmmc5_dat2 0x0: pullup/down disabled 0x1: pullup/down enabled | RW | 1 |
| 2:0 | SDMMC5_DAT2_MUXMODE | Functional multiplexing selection for pad sdmmc5_dat2 0x0: Select sdmmc5_dat2 0x1: Select mcspi2_cs1 0x3: Select gpio_149 0x5: Select sdmmc2_dat2 0x7: Select safe_mode | RW | 0x7 |

Mailbox

This chapter describes the Mailbox module in the device.

| Topic | Page |
|--------------------------------------------------|-------------|
| 19.1 Mailbox Overview | 4304 |
| 19.2 Mailbox Integration | 4306 |
| 19.3 Mailbox Functional Description | 4310 |
| 19.4 Mailbox Programming Guide | 4316 |
| 19.5 Mailbox Register Manual | 4319 |

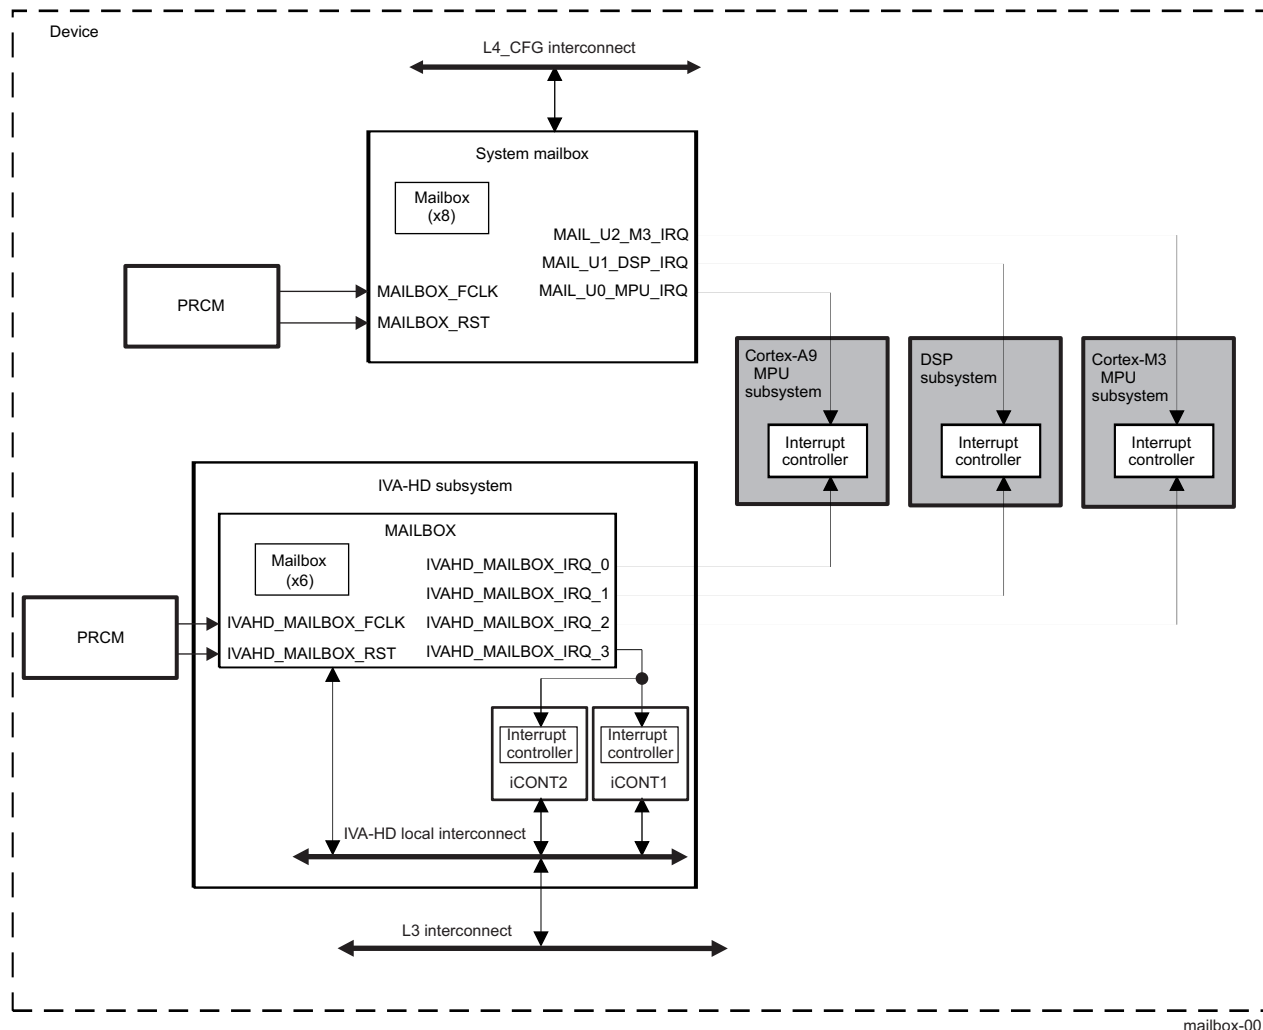

19.1 Mailbox Overview

Communication between the on-chip processors of the device uses a queued mailbox-interrupt mechanism.

The queued mailbox-interrupt mechanism allows the software to establish a communication channel between two processors through a set of registers and associated interrupt signals by sending and receiving messages (mailboxes).

Figure 19-1 shows an overview of the mailbox module.

Figure 19-1. Mailbox Overview

mailbox-001

There are two mailbox module instances in the device:

- System mailbox - used for Cortex-A9 microprocessor unit (Cortex-A9 MPU), digital signal processor (DSP) and Cortex-M3 microprocessor unit (Cortex-M3 MPU) communications.
- IVA-HD mailbox - used for communication between one internal to the IVA-HD subsystem user (imaging controller 1 - iCONT1, or imaging controller 2 - iCONT2) and three external to the IVA-HD subsystem users (Cortex-A9 MPU, DSP and Cortex-M3 MPU). This communication is insured through three pairs of mailboxes.

The mailbox module includes the following features:

- Three users for the system mailbox instance (Cortex-A9 MPU, DSP and Cortex-M3 MPU)/four users for the IVA-HD mailbox instance (iCONT1/iCONT2, Cortex-A9 MPU, DSP and Cortex-M3 MPU)
- Eight mailbox message queues for the system mailbox instance/six mailbox message queues for the

IVA-HD mailbox instance

- Flexible assignment of receiver and sender for each mailbox through interrupt configuration
- Three interrupts (one per user) for the system mailbox instance/four interrupts (one per user) for the IVA-HD mailbox instance
- 32-bit message width
- Four-message FIFO depth for each message queue
- Message reception and queue-not-full notification using interrupts
- Support of 16-/32-bit addressing scheme
- Power management support

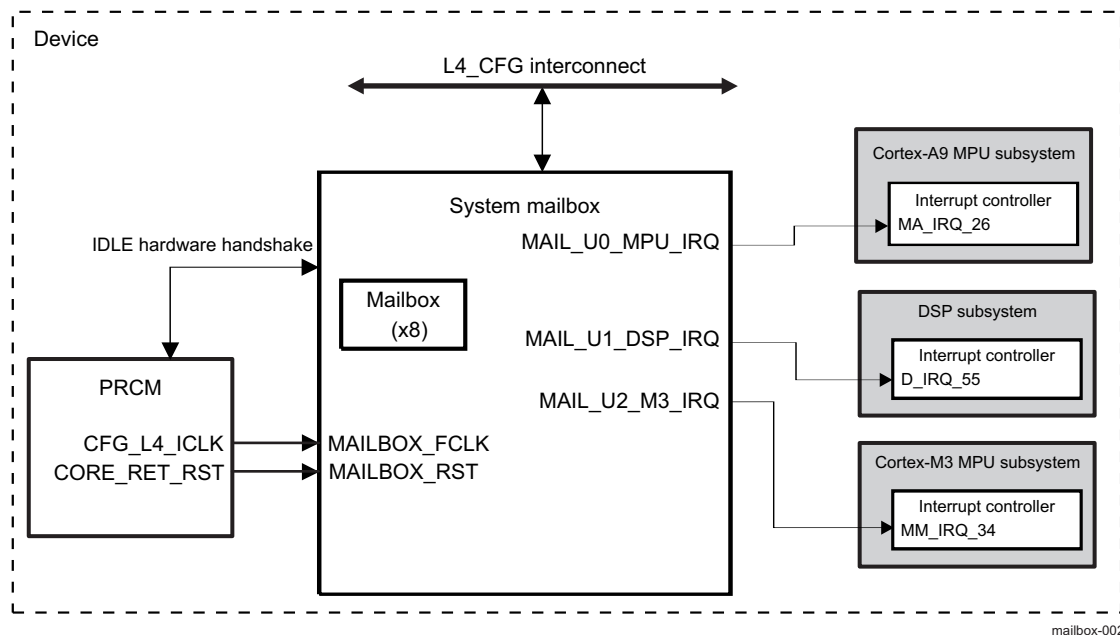

19.2 Mailbox Integration

This section describes the mailbox integration in the device, including information about clocks, resets, and hardware requests.

19.2.1 System Mailbox Integration

Figure 19-2 shows the system mailbox integration.

Figure 19-2. System Mailbox Integration

NOTE: For more information about the IDLE hardware handshake, see [Section 3.1.1.1.2, Module Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 19-1 through Table 19-3 summarize the system mailbox integration in the device.

Table 19-1. Integration Attributes

| Module Instance | Attributes | | |
|-----------------|--------------|--------------------|--------------|
| | Power Domain | Wake-Up Capability | Interconnect |
| SYSTEM_MAILBOX | PD_CORE | NA | L4_CFG |

Table 19-2. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| SYSTEM_MAILBOX | MAILBOX_FCLK | CFG_L4_ICLK | PRCM | System mailbox functional/interface clock. For information about PRCM clock gating and management, see Section 3.6.15, CD_L4_CFG Clock Management , in Chapter 3, Power, Reset, and Clock Management . |
| Resets | | | | |
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| SYSTEM_MAILBOX | MAILBOX_RST | CORE_RET_RST | PRCM | System mailbox hardware reset. For information about PRCM reset sources and distribution, see Section 3.5.4, Reset Domains , in Chapter 3, Power, Reset, and Clock Management . |

Table 19-3. Hardware Requests

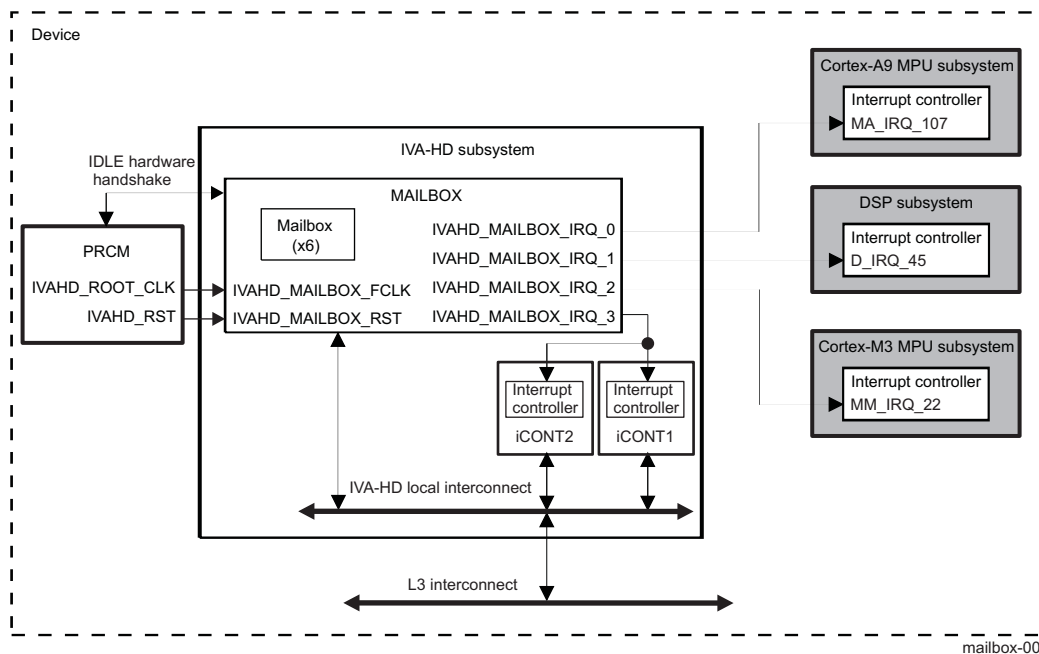

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| SYSTEM_MAILBOX | MAIL_U0_MPU_IRQ | MA_IRQ_26 | Cortex-A9 | System mailbox user 0 interrupt request. For information about Cortex-A9 MPU interrupt mapping, see Section 17.3.2, Interrupt Requests to the Cortex-A9 MPU Interrupt Controller , in Chapter 17, Interrupt Controllers . |
| | MAIL_U1_DSP_IRQ | D_IRQ_55 | DSP | System mailbox user 1 interrupt request. For information about DSP interrupt mapping, see Section 5.3.7, Interrupt Requests , in Chapter 5, DSP Subsystem . |
| | MAIL_U2_M3_IRQ | MM_IRQ_34 | Cortex-M3 | System mailbox user 2 interrupt request. For information about Cortex-M3 MPU interrupt mapping, see Section 17.3.3, Interrupt Requests to the Cortex-M3 MPU Interrupt Controller , in Chapter 17, Interrupt Controllers . |
| No DMA Requests | | | | |

NOTE: For information about interrupt source description, see [Section 19.3.4, Interrupt Requests](#).

19.2.2 IVA-HD Mailbox Integration

[Figure 19-3](#) shows the IVA-HD mailbox integration.

Figure 19-3. IVA-HD Mailbox Integration

NOTE: For more information about the IDLE hardware handshake, see [Section 3.1.1.1.2, Module Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

NOTE: The two imaging controllers - iCONT1 and iCONT2, are mapped on a shared interrupt line. The choice between them is done by masking mailbox interrupt on iCONT1 or iCONT2. For more information, see [, IVA-HD Imaging Controller](#) in [Chapter 6, IVA-HD Subsystem](#).

Table 19-4 through Table 19-6 summarize the IVA-HD mailbox integration in the device.

Table 19-4. Integration Attributes

| Module Instance | Attributes | | |
|-----------------|--------------|--------------------|---------------------------|
| | Power Domain | Wake-Up Capability | Interconnect |
| IVAHD_MAILBOX | PD_IVAHD | NA | IVA-HD local interconnect |

Table 19-5. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|--------------------------------------------|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| IVAHD_MAILBOX | IVAHD_MAILBOX_FCLK | IVAHD_CLK | PRCM | IVA-HD mailbox functional/interface clock. |
| Resets | | | | |
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| IVAHD_MAILBOX | IVAHD_MAILBOX_RST | IVAHD_RST | PRCM | IVA-HD mailbox hardware reset. |

Table 19-6. Hardware Requests

| | IVAHD_MAILBOX_IRQ_1 | D_IRQ_45 | DSP | IVA-HD mailbox user 1 interrupt request |
| | IVAHD_MAILBOX_IRQ_2 | MM_IRQ_22 | Cortex-M3 | IVA-HD mailbox user 2 interrupt request |
| | IVAHD_MAILBOX_IRQ_3 | IRQ#11 | iCONT1/iCONT2 | IVA-HD mailbox user 3 interrupt request. For information about iCONT1/iCONT2 interrupt mapping, see , <i>iCONT</i> . |
| No DMA Requests | | | | |

NOTE: For information about interrupt source description, see [Section 19.3.4, *Interrupt Requests*](#).

19.3 Mailbox Functional Description

NOTE: In the mailbox functional description, u is the user number and m is the mailbox number as follows:

- for the system mailbox module instance, $u=0$ to 2 and $m=0$ to 7
- for the IVA-HD mailbox module instance, $u=0$ to 3 and $m=0$ to 5

The mailbox module provides a means of communication through message queues among the users (depending on the mailbox module instance). The individual mailbox modules (8 for the system mailbox instance, 6 for the IVA-HD mailbox instance), or FIFOs, can associate (or de-associate) with any of the processors using the [MAILBOX_IRQENABLE_SET_u](#) (or [MAILBOX_IRQENABLE_CLR_u](#)) register.

CAUTION

For the IVA-HD mailbox instance, communication is possible only if one of the users is iCONT1 or iCONT2.

The mailbox module includes the following user subsystems:

- User 0: Cortex-A9 MPU subsystem ($u = 0$)
- User 1: DSP subsystem ($u = 1$)
- User 2: Cortex-M3 MPU subsystem ($u = 2$)
- User 3: IVA-HD subsystem ($u = 3$) - only available to the IVA-HD mailbox instance

Each user has a dedicated interrupt signal from the corresponding mailbox module instance and dedicated interrupt enabling and status registers.

Each [MAILBOX_IRQSTATUS_RAW_u](#)/[MAILBOX_IRQSTATUS_CLR_u](#) interrupt status register corresponds to a particular user.

For the system mailbox instance, a user can query its interrupt status register through the L4_CFG interconnect.

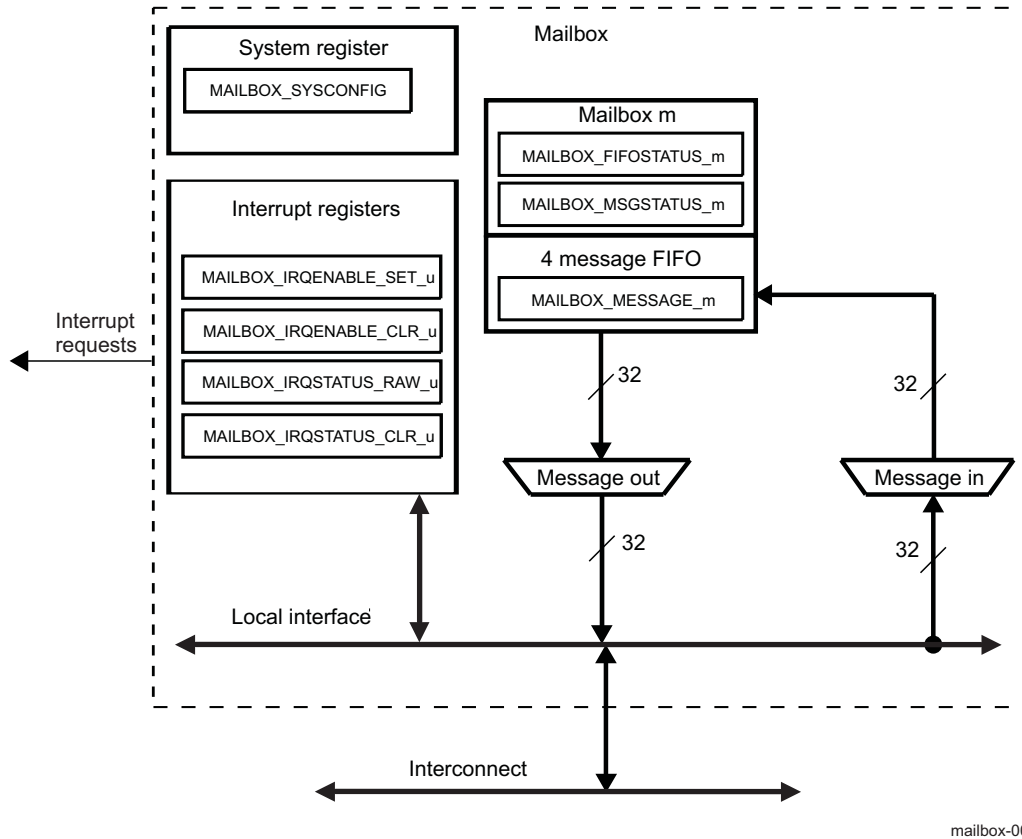

For the IVA-HD mailbox instance, a user can query its interrupt status register as follows:

- Cortex-A9 MPU and Cortex-M3 MPU - through the L3 interconnect
- iCONT1/iCONT2 and DSP - private access (directly through the IVA-HD local interconnect)

19.3.1 Mailbox Block Diagram

Figure 19-4 shows the mailbox block diagram.

Figure 19-4. Mailbox Block Diagram

NOTE: The interrupt requests and the interconnect depend on the mailbox module instance. For more information, see [Section 19.2, Mailbox Integration](#).

19.3.2 Mailbox Software Reset

The mailbox module supports a software reset through the [MAILBOX_SYSCONFIG\[0\]](#) SOFTRESET bit. Setting this bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. Reading the [MAILBOX_SYSCONFIG\[0\]](#) SOFTRESET bit gives the status of the software reset:

- Read 1: the software reset is on-going.
- Read 0: the software reset is complete.

The software must ensure that the software reset completes before doing mailbox operations.

19.3.3 Mailbox Power Management

[Table 19-7](#) describes power-management features available for the mailbox module.

NOTE:

- For information about source clock gating and sleep/wake-up transitions description, see [Section 3.1.1.1.4, Clock-Domain Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- For descriptions of EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see [Section 3.1.1.1.2, Module-Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 19-7. Local Power Management Features

| Feature | Registers | Description |
|------------------------|-------------------------------------------------------------|--------------------------------------------------------|
| Clock autogating | NA | Feature not available |
| Slave idle modes | MAILBOX_SYSCONFIG [3:2] SIDLEMODE bit field | Force-idle, no-idle and smart-idle modes are available |
| Clock activity | NA | Feature not available |
| Master standby modes | NA | Feature not available |
| Global wake-up enable | NA | Feature not available |
| Wake-up sources enable | NA | Feature not available |

The mailbox module can be configured using the [MAILBOX_SYSCONFIG](#)[3:2] SIDLEMODE bit field to one of the following acknowledgment modes:

- Force-idle mode (SIDLEMODE = 0x0): The mailbox module immediately enters the idle state on receiving a low-power-mode request from the PRCM module. In this mode, the software must ensure that there are no asserted output interrupts before requesting this mode to go into the idle state.
- No-idle mode (SIDLEMODE = 0x1): The mailbox module never enters the idle state.
- Smart-idle mode (SIDLEMODE = 0x2): After receiving a low-power-mode request from the PRCM module, the mailbox module enters the idle state only after all asserted output interrupts are acknowledged.

19.3.4 Mailbox Interrupt Requests

An interrupt request allows the user of the mailbox to be notified when a message is received or when the message queue is not full. There is one interrupt per user.

NOTE: For more information about interrupt requests, see [Section 19.2, Mailbox Integration](#).

[Table 19-8](#) lists the event flags, and their mask, that can cause module interrupts.

Table 19-8. Interrupt Events

| Non-Maskable Event Flag ⁽¹⁾ | Maskable Event Flag | Event Mask Bit | Event Unmask Bit | Description |
|---------------------------------------------------------------------------|---------------------------------------------------------------------------|---------------------------------------------------------------------------|---------------------------------------------------------------------------|---------------------------------------------|
| MAILBOX_IRQSTATUS_RAW_u [0+m*2] NEWMSGSTATUSUUM Bm | MAILBOX_IRQSTATUS_CLR_u [0+m*2] NEWMSGSTATUSUUM Bm | MAILBOX_IRQENABLE_CLR_u [0+m*2] NEWMSGSTATUSUUM Bm | MAILBOX_IRQENABLE_SET_u [0+m*2] NEWMSGSTATUSUUM Bm | Mailbox <i>m</i> receives a new message. |
| MAILBOX_IRQSTATUS_RAW_u [1+m*2] NOTFULLSTATUSUUM Bm | MAILBOX_IRQSTATUS_CLR_u [1+m*2] NOTFULLSTATUSUUM Bm | MAILBOX_IRQENABLE_CLR_u [1+m*2] NOTFULLSTATUSUUM Bm | MAILBOX_IRQENABLE_SET_u [1+m*2] NOTFULLSTATUSUUM Bm | Mailbox <i>m</i> message queue is not full. |

⁽¹⁾ [MAILBOX.MAILBOX_IRQSTATUS_RAW_u](#) register is mostly used for debug purposes.

CAUTION

Once an event generating the interrupt request has been processed by the software, it must be cleared by writing a logical 1 in the corresponding bit of the [MAILBOX_IRQSTATUS_CLR_u](#) register.

Writing a logical 1 in a bit of the [MAILBOX_IRQSTATUS_CLR_u](#) register will also clear to 0 the corresponding bit in the appropriate [MAILBOX_IRQSTATUS_RAW_u](#) register.

An event can generate an interrupt request when a logical 1 is written to the corresponding unmask bit in the [MAILBOX_IRQENABLE_SET_u](#) register. Events are reported in the appropriate [MAILBOX_IRQSTATUS_CLR_u](#) and [MAILBOX_IRQSTATUS_RAW_u](#) registers.

An event stops generating interrupt requests when a logical 1 is written to the corresponding mask bit in the [MAILBOX_IRQENABLE_CLR_u](#) register. Events are only reported in the appropriate [MAILBOX_IRQSTATUS_RAW_u](#) register.

In case of the [MAILBOX_IRQSTATUS_RAW_u](#) register, the event is reported in the corresponding bit even if the interrupt request generation is disabled for this event.

19.3.5 Mailbox Assignment

19.3.5.1 Description

To assign a receiver to a mailbox, set the new message interrupt enable bit corresponding to the desired mailbox in the [MAILBOX_IRQENABLE_SET_u](#) register. The receiver reads the [MAILBOX_MESSAGE_m](#) register to retrieve a message from the mailbox.

An alternate method for the receiver that does not use the interrupts is to poll the [MAILBOX_FIFOSTATUS_m](#) and/or [MAILBOX_MSGSTATUS_m](#) registers to know when to send or retrieve a message to or from the mailbox. This method does not require assigning a receiver to a mailbox. Because this method does not include the explicit assignment of the mailbox, the software must avoid having multiple receivers use the same mailbox, which can result in incoherency.

To assign a sender to a mailbox, set the queue-not-full interrupt enable bit of the desired mailbox in the [MAILBOX_IRQENABLE_SET_u](#) register, where *u* is the number of the sending user. However, direct allocation of a mailbox to a sender is not recommended because it can cause the sending processor to be constantly interrupted.

It is recommended that register polling be used to:

- Check the status of either the [MAILBOX_FIFOSTATUS_m](#) or [MAILBOX_MSGSTATUS_m](#) registers
- Write the message to the corresponding [MAILBOX_MESSAGE_m](#) register, if space is available.

The sender might use the queue-not-full interrupt when the initial mailbox status check indicates the mailbox is full. In this case, the sender can enable the queue-not-full interrupt for its mailbox in the appropriate [MAILBOX_IRQENABLE_SET_u](#) register. This allows the sender to be notified by interrupt only when a FIFO queue has at least one available entry.

Reading the [MAILBOX_IRQSTATUS_CLR_u](#) register determines the status of the new message and the queue-not-full interrupts for a particular user. Writing 1 to the corresponding bit in the [MAILBOX_IRQSTATUS_CLR_u](#) register acknowledges, and subsequently clears, an interrupt.

CAUTION

Assigning multiple senders or multiple receivers to the same mailbox is not recommended.

19.3.6 Sending and Receiving Messages

19.3.6.1 Description

When a 32-bit message is written to the [MAILBOX_MESSAGE_m](#) register, the message is appended into the FIFO queue. This queue holds four messages. If the queue is full, the message is discarded.

Queue overflow can be avoided by first reading the [MAILBOX_FIFOSTATUS_m](#) register to check that the mailbox message queue is not full before writing a new message to it.

Reading the [MAILBOX_MESSAGE_m](#) register returns the message at the beginning of the FIFO queue and removes it from the queue. If the FIFO queue is empty when the [MAILBOX_MESSAGE_m](#) register is read, the value 0 is returned.

The new message interrupt is asserted when at least one message is in the mailbox message FIFO queue. To determine the number of messages in the mailbox message FIFO queue, read the [MAILBOX_MSGSTATUS_m](#) register.

19.3.7 16-Bit Register Access

19.3.7.1 Description

So that 16-bit processors can access the mailbox module, the module allows 16-bit register read and write access, with restrictions for the [MAILBOX_MESSAGE_m](#) registers. The 16-bit half-words are organized in little endian fashion; that is, the least-significant 16 bits are at the low address and the most-significant 16 bits are at the high address (low address + 0x02).

All mailbox module registers can be read or written to directly using individual 16-bit accesses with no restriction on interleaving, except the [MAILBOX_MESSAGE_m](#) registers, which must always be accessed by either single 32-bit accesses or two consecutive 16-bit accesses.

CAUTION

When using 16-bit accesses, it is critical to ensure that the mailbox used has only one assigned receiver and only one assigned sender.

When using 16-bit accesses to the [MAILBOX_MESSAGE_m](#) registers, the order of access must be the least-significant half-word first (low address) and the most-significant half-word last (high address). This requirement is because of the update operation by the message FIFO of the [MAILBOX_MSGSTATUS_m](#) registers. The update of the FIFO queue contents and the associated status registers and possible interrupt generation occurs only when the most-significant 16 bits of a [MAILBOX_MESSAGE_m](#) are accessed.

19.3.8 Example of Communication

Figure 19-5 shows an example of communication between Cortex-A9 MPU and DSP subsystems.

Figure 19-5. Example of Communication

19.4 Mailbox Programming Guide

19.4.1 Mailbox Low-level Programming Models

This section covers the low-level hardware programming sequences for configuration and usage of the mailbox module.

19.4.1.1 Global Initialization

19.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the mailbox module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration of the mailbox.

See [Section 19.2, Mailbox Integration](#), for further information.

Table 19-9. Global Initialization of Surrounding Modules for System Mailbox

| Surrounding Modules | Comments |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRCM | Mailbox functional/interface clock must be enabled. For more information, see Section 3.6.15 , <i>CD_L4_CFG Clock Domain</i> , in Chapter 3, Power, Reset, and Clock Management . |
| Interrupt Controllers | Cortex-A9 MPU, or Cortex-M3 MPU, or DSP interrupt controller must be configured to enable the interrupt request generation to the Cortex-A9 MPU, or Cortex-M3 MPU, or DSP subsystem. For information about enabling interrupts in Cortex-A9 MPU INTC, see the <i>ARM Cortex™-A9 MPCore Technical Reference Manual</i> (available at infocenter.arm.com/help/index.jsp). For information about enabling interrupts in Cortex-M3 MPU INTC, see the <i>ARM Cortex™-M3 Technical Reference Manual</i> (available at infocenter.arm.com/help/index.jsp). For information about enabling interrupts in DSP INTC, see Chapter 5, DSP Subsystem . |
| Interconnect | For information about L4-CFG interconnect configuration, see Section 13.3, L4 Interconnects , in Chapter 13, Interconnect . |

Table 19-10. Global Initialization of Surrounding Modules for IVA-HD Mailbox

| Surrounding Modules | Comments |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRCM | Mailbox functional/interface clock must be enabled. For more information, see Chapter 3, Power, Reset, and Clock Management . |
| Interrupt Controllers | Cortex-A9 MPU, or Cortex-M3 MPU, or DSP, or iCONT1/iCONT2 interrupt controller must be configured to enable the interrupt request generation to the Cortex-A9 MPU, or Cortex-M3 MPU, or DSP, or IVA-HD subsystem. For information about enabling interrupts in Cortex-A9 MPU INTC, or Cortex-M3 MPU INTC, or DSP INTC, see Table 19-9, Global Initialization of Surrounding Modules for System Mailbox . For information about enabling interrupts in iCONT1/iCONT2, see <i>iCONT</i> in Chapter 6, IVA-HD Subsystem . |
| Interconnect | For information about L3 interconnect configuration, see Section 13.2, L3 Interconnects , in Chapter 13, Interconnect . |

19.4.1.1.2 Mailbox Global Initialization

19.4.1.1.2.1 Main Sequence - Mailbox Global Initialization

This procedure initializes the mailbox module after a power-on or software reset.

Table 19-11. Mailbox Global Initialization

| Step | Register/ Bit Field / Programming Model | Value |
|------------------------------|---------------------------------------------------|-------|
| Perform a software reset | MAILBOX_SYSCONFIG [0] SOFTRESET | 0x1 |
| Wait until reset is complete | MAILBOX_SYSCONFIG [0] SOFTRESET | = 0x0 |
| Set idle mode configuration | MAILBOX_SYSCONFIG [3:2] SIDLEMODE | 0x- |

19.4.1.2 Mailbox Operational Modes Configuration

19.4.1.2.1 Mailbox Processing modes

19.4.1.2.1.1 Main Sequence - Sending a Message (Polling Method)

Table 19-12. Sending a Message (Polling Method)

| Step | Register/ Bit Field / Programming Model | Value |
|---------------------------------------------------|------------------------------------------------------------|--------|
| IF : Is FIFO full ? | MAILBOX_FIFOSTATUS_m[0] FIFOFULLMB | = 0x1 |
| Wait until at least one message slot is available | MAILBOX_FIFOSTATUS_m[0] FIFOFULLMB | = 0x0 |
| ELSE | | |
| Write message | MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM | 0x---- |
| ENDIF | | |

19.4.1.2.1.2 Main Sequence - Sending a Message (Interrupt Method)

Table 19-13. Sending a Message (Interrupt Method)

| Step | Register/ Bit Field / Programming Model | Value |
|---------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|--------|
| IF : Is FIFO full ? | MAILBOX_FIFOSTATUS_m[0] FIFOFULLMB | = 0x1 |
| Enable interrupt event | MAILBOX_IRQENABLE_SET_u[1+ m*2] | 0x1 |
| User (processor) can perform another task until interrupt occurs See Section 19.4.1.3.1 for interrupt handling in sending mode | | |
| ELSE | | |
| Write message | MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM | 0x---- |
| ENDIF | | |

19.4.1.2.1.3 Main Sequence - Receiving a Message (Polling Method)

Table 19-14. Receiving a Message (Polling Method)

| Step | Register/ Bit Field / Programming Model | Value |
|--------------------------------------------------|------------------------------------------------------------|--------|
| IF : Number of messages is not equal to 0 | MAILBOX_MSGSTATUS_m[2:0] NBOFMSGMB | != 0x0 |
| Read message | MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM | 0x---- |
| ENDIF | | |

19.4.1.2.1.4 Main Sequence - Receiving a Message (Interrupt Method)

Table 19-15. Receiving a Message (Interrupt Method)

| Step | Register/ Bit Field / Programming Model | Value |
|-----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|-------|
| Enable interrupt event | MAILBOX_IRQENABLE_SET_u[0 + m*2] | 0x1 |
| User (processor) can perform another task until interrupt occurs See Section 19.4.1.3.2 for interrupt handling in receiving mode | | |

19.4.1.3 Mailbox Events Servicing

19.4.1.3.1 Events Servicing in Sending Mode

Table 19-16 describes the events servicing in sending mode.

Table 19-16. Events Servicing in Sending Mode

| Step | Register/ Bit Field / Programming Model | Value |
|----------------------------------|--------------------------------------------|--------|
| Read interrupt status bit | MAILBOX_IRQSTATUS_CLR_u[1 + m*2] | 0x1 |
| Write message | MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM | 0x---- |
| Write 1 to acknowledge interrupt | MAILBOX_IRQSTATUS_CLR_u[1 + m*2] | 0x1 |

19.4.1.3.2 Events Servicing in Receiving Mode

Table 19-17 describes the events servicing in receiving mode.

Table 19-17. Events Servicing in Receiving Mode

| Step | Register/ Bit Field / Programming Model | Value |
|----------------------------------------------------|--------------------------------------------|--------|
| Read interrupt status bit | MAILBOX_IRQSTATUS_CLR_u[0 + m*2] | 0x1 |
| IF : Number of messages is not equal to 0 ? | MAILBOX_MSGSTATUS_m[2:0] NBOFMSGMB | != 0x0 |
| Read message | MAILBOX_MESSAGE_m[31:0] MESSAGEVALUEMBM | 0x---- |
| ELSE | | |
| Write 1 to acknowledge interrupt | MAILBOX_IRQSTATUS_CLR_u[0 + m*2] | 0x1 |
| ENDIF | | |

Memory Management Units

This chapter describes the memory management units (MMUs).

| Topic | Page |
|---------------------------------------------|------|
| 20.1 MMU Overview | 4335 |
| 20.2 MMU Integration | 4336 |
| 20.3 MMU Functional Description | 4339 |
| 20.4 MMU Low-level Programming Models | 4352 |
| 20.5 MMU Register Manual | 4356 |

20.1 MMU Overview

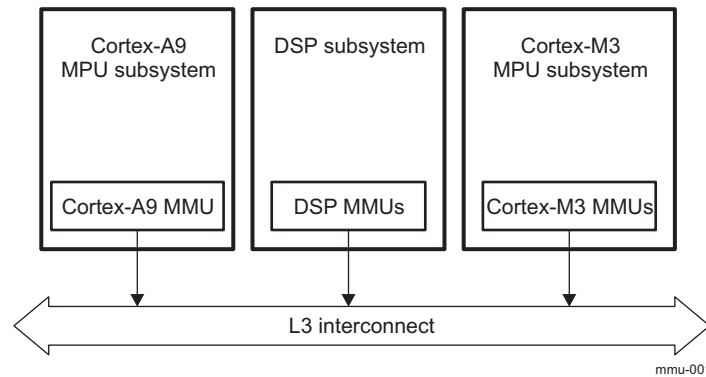

A memory management unit (MMU) is a hardware component responsible for handling accesses to memory requested by a processing unit. MMU functions include translation of virtual addresses to physical addresses (that is, virtual memory management) and cache control.

The device contains the following MMUs:

- In DSP - L1 Shared cache MMU and attribute MMU.
- In Dual Cortex-M3 MPU Subsystem - L1 Shared cache MMU and L2 MMU
- Cortex-A9 MMU

Figure 20-1 shows the MMU instances in the device.

Figure 20-1. Device MMU Instances

20.2 MMU Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

The MMU communicates accesses from the requestor (DSP, Cortex-M3 microprocessor unit (MPU), or Cortex-A9 MPU) to the L3 main interconnect, performing virtual to physical address translation. Although all MMUs are programmed (configured) through the L3 interconnect, the DSP MMU can be programmed both through the L3 interconnect or through the DSP local interconnect. DSP MMU and Cortex-M3 MMU error conditions are signaled as interrupts to the system main processor Cortex-A9 MPU.

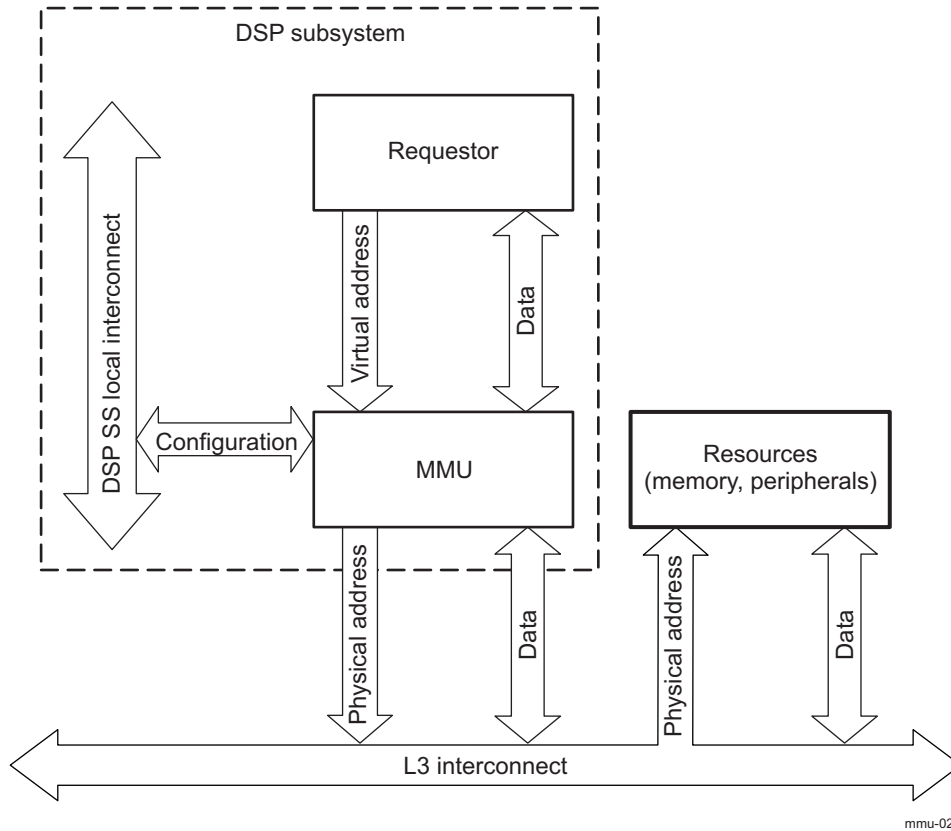

Figure 20-2 shows typical MMU integration.

Figure 20-2. MMU Integration

NOTE: All MMUs are programmed through the L3 interconnect.

Figure 20-3. DSP MMU Integration

mmu-024

NOTE: The DSP MMU can be programmed from both the DSP local interconnect and from the L3 interconnect.

Table 20-1 through Table 20-3 summarize the MMU integration in the various modules of the device.

Table 20-1. Integration Attributes

| Module Instance | Power Domain |
|----------------------------------------|--------------|
| CORTEXM3_L2MMU and CORTEXM3_SCACHE_MMU | PD_CORE |
| CORTEXA9_MMU | PD_MPU |

Table 20-2. Clocks and Resets

| Clocks | | | | |
|----------------------------------------|-------------------------|--------------------|----------|----------------------------------------------------------------------------------------------------------------------------------|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| CORTEXA9_MMU | ARM_FCLK | MPU_DPLL_CLK | MPU DPLL | Internal clock in the Cortex-A9 MPU subsystem; supplies the MMU in Cortex-A9. |
| CORTEXM3_L2MMU and CORTEXM3_SCACHE_MMU | MPU_M3_CLK | MPU_M3_CLK | PRCM | External clock from the power, reset, and clock management (PRCM) module; supplies the shared cache MMU and L2 MMU in Cortex-M3. |
| Resets | | | | |
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| CORTEXM3_L2MMU | CORTEXM3_PWRON_RST | CORTEXM3_PWRON_RST | PRCM | Power-on reset signal for the Cortex-M3 MPU subsystem |
| | CORTEXM3_RST3 | CORTEXM3_RST3 | PRCM | Reset signal to the L2 MMU |

Table 20-2. Clocks and Resets (continued)

| | | | | |
|---------------------|------------------|------------------|------|------------------------------------------------------------------------------|
| CORTEXM3_SCACHE_MMU | CORTEXM3_RST3 | CORTEXM3_RST3 | PRCM | Reset signal for the shared cache MMU |
| | CORTEXM3_RET_RST | CORTEXM3_RET_RST | PRCM | Retention reset signal for the Cortex-M3 MPU subsystem |
| CORTEXA9_MMU | MPU_PWRON_RST | MPU_PWRON_RST | PRCM | Power-on reset signal to the MMU and the rest of the Cortex-A9 MPU subsystem |
| | MPU_RST | MPU_RST | PRCM | Reset signal to the MMU and the rest of the Cortex-A9 MPU subsystem |

Table 20-3. Hardware Requests

| Interrupt Requests | | | | |
|---------------------|------------------------------|-------------------------|---------------|--------------------------------------------------------------------------------|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| CORTEXM3_L2MMU | CORTEXM3_MMU_IRQ | MA_IRQ_100 | MPU_INT_C | Cortex-M3 MPU L2MMU interrupt to the main MPU subsystem |
| | XLATE_MMU_FAULT | MM_IRQ_0 | CortexM3_INTC | Internal interrupt from the L2MMU to the Cortex-M3 interrupt controller (INTC) |
| CORTEXM3_SCACHE_MMU | SHARED_CACHE_MMU_C PU_INT | MM_IRQ_1 | CortexM3_INTC | Internal interrupt from the shared cache MMU to the CortexM3 INTC |

NOTE:

- For a description of the interrupt source, see [Section 20.3.5, Interrupt Requests](#).

There are 5 MMU modules in the device:

- Shared cache MMU – there are two Share cache MMUs, one in the Cortex-M3 MPU and other in DSP subsystem. Refer to the corresponding chapters for more information.
- L2 MMUs – there are two L2 MMUs, one in the Cortex-M3 MPU and other in DSP subsystem. The L2 MMUs are directly operating with the L3 interconnect (shared device memory space). These L2 MMUs are described in this chapter.
- Cortex-A9 MMU – this MMU is located in the ARM Cortex-A9 processor. For information about this MMU, see the *ARM® Cortex™-A9 MPCore Technical Reference Manual* (available at infocenter.arm.com/help/index.jsp).

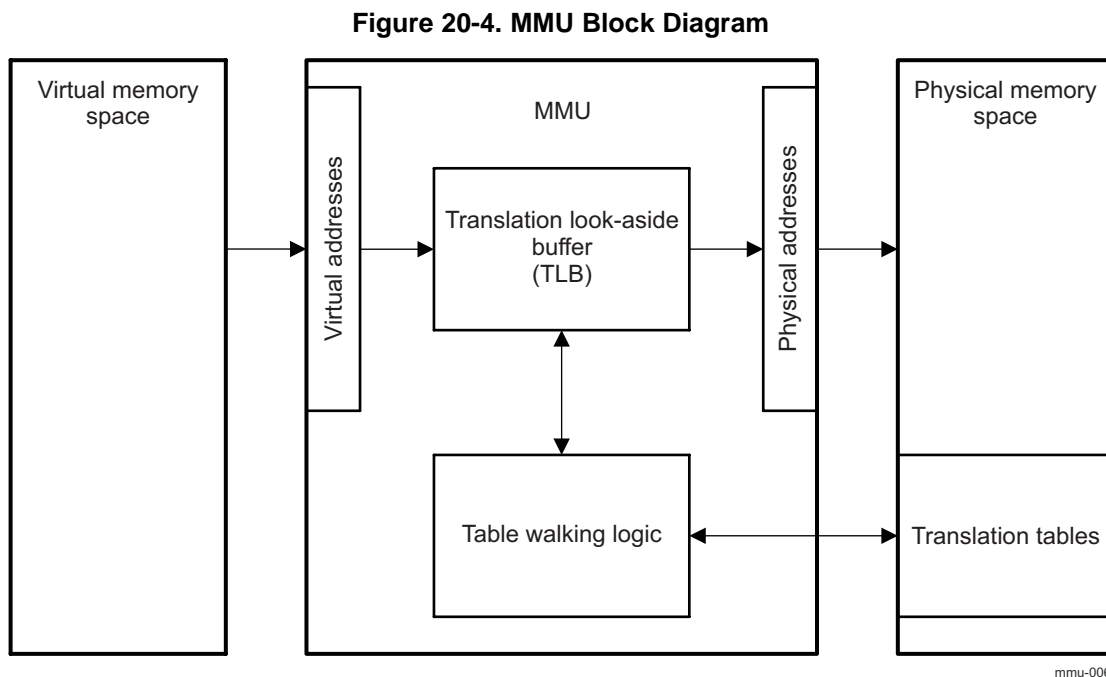

NOTE: There is PAT module in the Dynamic Memory Manager, which has similar to the MMU functionality. Refer to the DMM chapter, for more information.

20.3 MMU Functional Description

20.3.1 MMU Block Diagram

The MMU manages the virtual to physical address translation for external addresses, as well as endianness conversion. The MMU can be programmed through the L3 interconnect. MMU programming is expected to be accomplished by the Cortex-A9 MPU, except for the DSP MMU, of which the configuration can be accomplished through the DSP local interconnect.

Figure 20-4 is the MMU block diagram.

Each table entry describes the translation of one contiguous memory region. For a description of the structure of these tables, see [Section 20.3.1.2, Translation Tables](#).

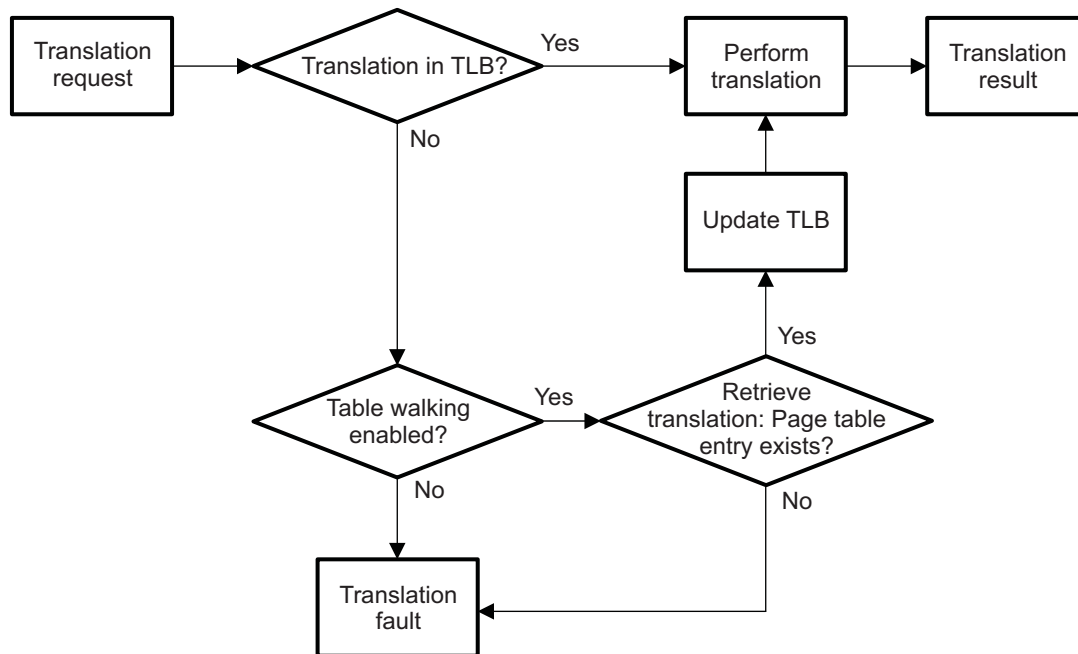

Two major functional units exist in the MMU to provide address translation automatically based on the table entries:

- The table walker automatically retrieves the correct translation table entry for a requested translation. If two-level translation is used (for the translation of small memory pages), the table walker also automatically reads the required second-level translation table entry. The two-level translation is described later in the chapter.
- The translation look-aside buffer (TLB) stores recently used translation entries, acting like a cache of the translation table.

20.3.1.1 MMU Address Translation Process

Whenever an address translation is requested (that is, for every access with the MMU enabled), the MMU first checks whether the translation is contained in the TLB, which acts like a cache storing recent translations. The TLB can also be programmed manually to ensure that time-critical data can be translated without delay.

If the requested translation is not in the TLB, the table-walking logic retrieves this translation from the translation table(s), and then updates the TLB. The address translation is then performed. [Figure 20-5](#) summarizes the process.

Figure 20-5. Translation Process

mmu-007

20.3.1.2 Translation Tables

The translation of virtual to physical addresses is based on entries in translation tables that define the following properties:

- Address translation, that is, the correspondence between virtual and physical addresses
- Size of the memory region the entry translates
- Endianness, data access size, and the mixed property of this memory region

The virtual addresses index the translation tables. Each virtual address corresponds to exactly one entry in the translation table.

20.3.1.2.1 Translation Table Hierarchy

When developing a table-based address translation scheme, one of the most important design parameters is the memory page size described by each translation table entry. MMU instances support 4KB and 64KB pages, a 1MB section, and a 16MB supersection. Using bigger page sizes means a smaller translation table.

Using a smaller page size greatly increases the efficiency of dynamic memory allocation and defragmentation. That is why many operating systems (OSs) can operate on memory blocks as small as 4KB; however, the smaller size implies a more complex table structure.

A quick calculation shows that using 4KB memory pages with one translation table would require one million entries to span the entire 4GB address range. The table itself would be 32MB, a size that is not feasible.

However, using bigger pages greatly reduces the functionality of the OS memory management. Implementing a two-level hierarchy reconciles these two requirements. Within this hierarchy, one first-level translation table describes the translation properties based on 1MB memory regions.

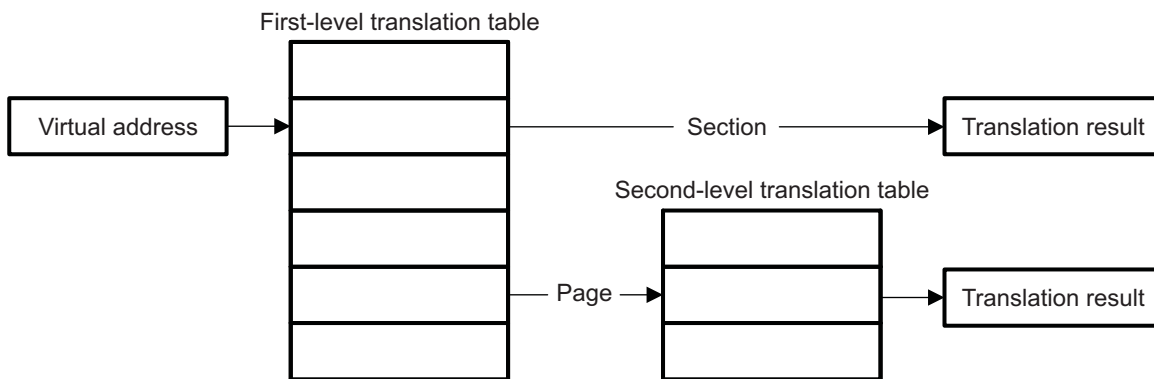

Each of the entries in this first-level translation table can specify the following:

- The translation properties for a big memory section. This memory section can be either 1MB (section) or 16MB (supersection). In this case, all translation parameters are specified in the first-level translation table entry.

- A pointer to a second-level translation table that specifies individual translation properties based on smaller pages within the 1MB page of memory. These pages can be either 64KB (large page) or 4KB (small page). In this case, the actual translation parameters are specified in the second-level translation table entry. The first-level translation table entry specifies only the base address of the second-level translation table.

This hierarchical approach means that additional translation information for smaller pages must be provided only when the pages are actually used. Figure 20-6 shows the hierarchy.

Figure 20-6. Translation Hierarchy

mmu-008

The structure of the first and second-level translation tables and their entries are described in more detail in Section 20.3.1.2.2, *First-Level Translation Table*, and Section 20.3.1.2.3, *Two-Level Translation*.

20.3.1.2.2 First-Level Translation Table

The first-level translation table describes the translation properties for 1MB sections. To describe a 4GB address range requires 4096 32-bit entries (so-called first-level descriptors).

The first-level translation table start address must be aligned on a multiple of the table size with a 128-byte minimum. Consequently, an alignment of at least 16K bytes is required for a complete 4096-entry table; that is, at least the last fourteen address bits must be zero.

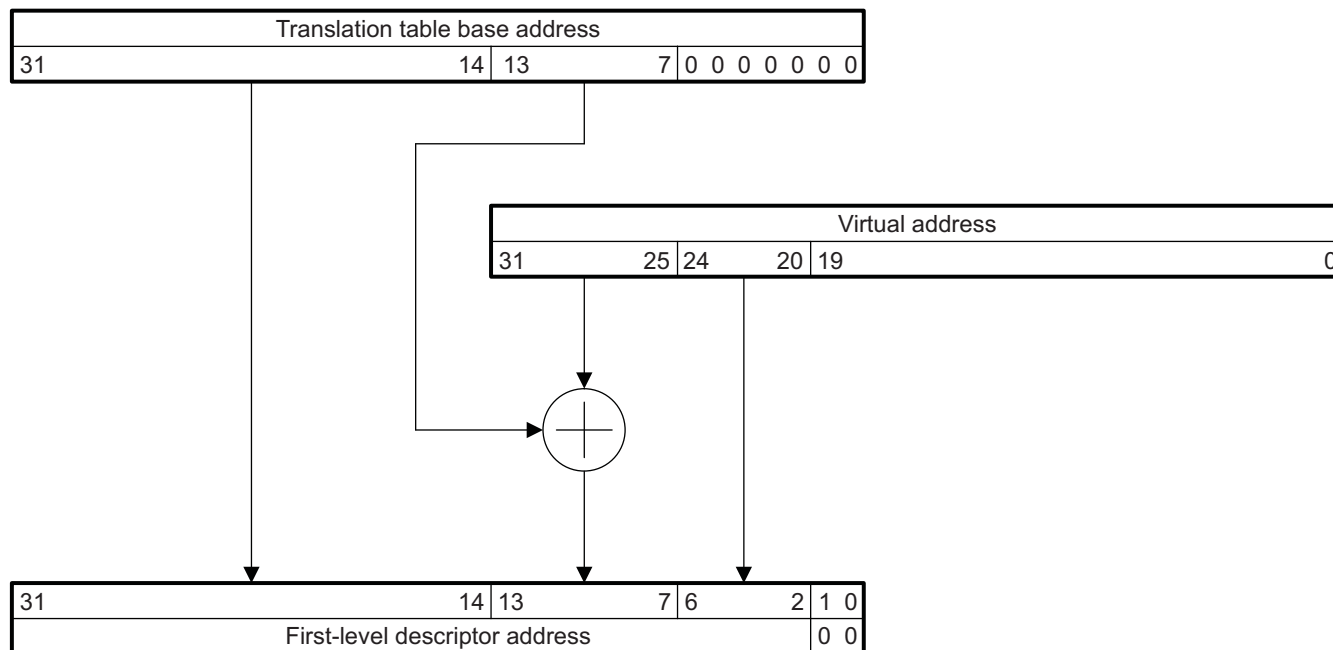

The start address of the first-level translation table is specified by the so-called translation table base. The table is indexed by the upper 12-bits of the virtual address. Figure 20-7 shows this mechanism.

Figure 20-7. First-level Descriptor Address Calculation

mmu-009

To summarize, the translation table base and the translation table index together define the first-level descriptor address. Figure 20-8 outlines the precise mechanism used to calculate this address.

Figure 20-8. Detailed First-Level Descriptor Address Calculation

mmu-010

As an example of this mechanism, consider a translation table base address of 0x8000:0000 and a virtual address of 0x1234:5678. In this case, the first-level descriptor address is $0x8000:0000 + (0x1234 \ll 2) = 0x8000:048C$.

20.3.1.2.2.1 First-Level Descriptor Format

Each first-level descriptor provides either the complete address translation for 1MB or 16MB sections or provides a pointer to a second-level translation table for 4KB or 64KB pages. [Table 20-4](#) shows the first-level descriptor format.

Table 20-4. First-Level Descriptor Format

| First-Level Descriptor Format | | | | | | | | | | | | |
|---------------------------------------------|-------|----|----|----|----|------------------|-------|-------|-----|---|---|--------------|
| 31:24 | 23:20 | 19 | 18 | 17 | 16 | 15 | 14:12 | 11:10 | 9:2 | 1 | 0 | |
| X | | | | | | | | | | 0 | 0 | Fault |
| Second-Level Translation Table Base Address | | | | | | | | | X | 0 | 1 | Page |
| Section Base Address | | X | 0 | M | X | E ⁽¹⁾ | X | ES | X | 1 | 0 | Section |
| Supersection Base Address | | X | 1 | M | X | E | X | ES | X | 1 | 0 | Supersection |
| X | | | | | | | | | | 1 | 1 | Fault |

⁽¹⁾ See for endianness limitations.

M = Mixed region: 0 = Page-based endianness, 1 = Access-based endianness

E = Endianness: 0 = Little endian, 1 = Big endian (endianness is locked on little endian)

ES = Element Size: 00 = 8-bit, 01 = 16-bit, 10 = 32-bit, 11 = No endianness conversion

X = Don't care

20.3.1.2.2.2 First-Level Page Descriptor Format

If a translation granularity smaller than 1MB is required, a two-level translation process is used. In this case, the first-level block descriptor specifies only the start address of a second-level translation table. The second-level translation table entries specify the actual translation properties.

20.3.1.2.2.3 First-Level Section Descriptor Format

Each section descriptor in the first-level translation table specifies the complete translation properties for a 1MB section or a 16MB supersection.

NOTE: Supersection descriptors must be repeated 16 times, because each descriptor in the first-level translation table describes 1MB of memory. If an access points to a descriptor that is not initialized, the MMU will behave in an unpredictable way.

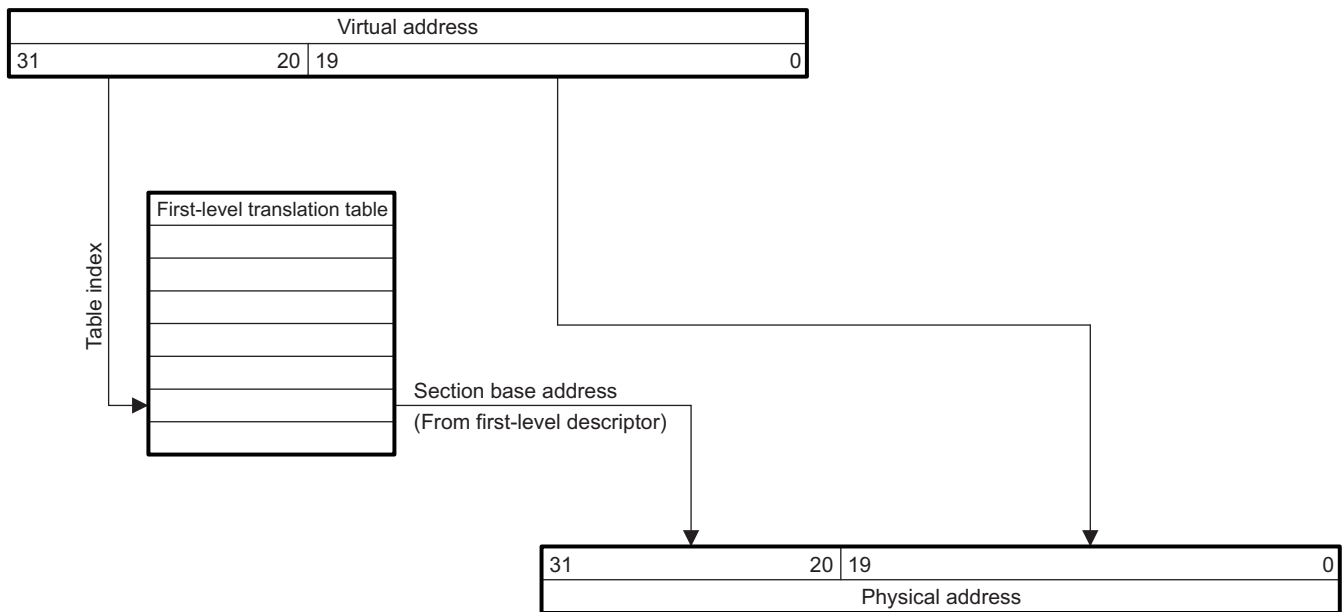

In addition to the address translation itself, three parameters are specified in the section descriptors:

- Endianness
The *endianness* parameter specifies whether the memory section uses a big- or little-endian data format. This parameter is locked to little endian. See for more information.
- Element size
The *element size* parameter can optionally specify the data access size (8, 16, or 32 bits) for all data items in the defined section.
- Mixed region
The *mixed region* parameter specifies whether the information about the data access size is detected from the access itself (access-based detection) or if the specified element size parameter is used (page-based detection). For example, the specified element size parameter can be used when several smaller sized accesses are packed into a bigger sized access, such as two 16-bit accesses packed into one 32-bit access. In this case, with no specified data access size, 32 bits would be the access size detected, leading to an incorrect result. To avoid this problem, specify the data access size for the memory section.

20.3.1.2.2.4 Section Translation Summary

Sections and supersections can be translated based solely on the information in the first-level translation table. Figure 20-9 summarizes the address translation process for a section.

Figure 20-9. Section Translation Summary

mmu-011

20.3.1.2.2.5 Supersection Translation Summary

The translation of a supersection is similar to the translation of a section. The difference is that for a supersection only bits 31 to 24 index into the first-level translation table. The last four bits of the table index are implicitly assumed to be zero as there are 16 identical consecutive entries for a supersection.

Figure 20-10 shows the translation mechanism for a supersection.

Figure 20-10. Supersection Translation Summary

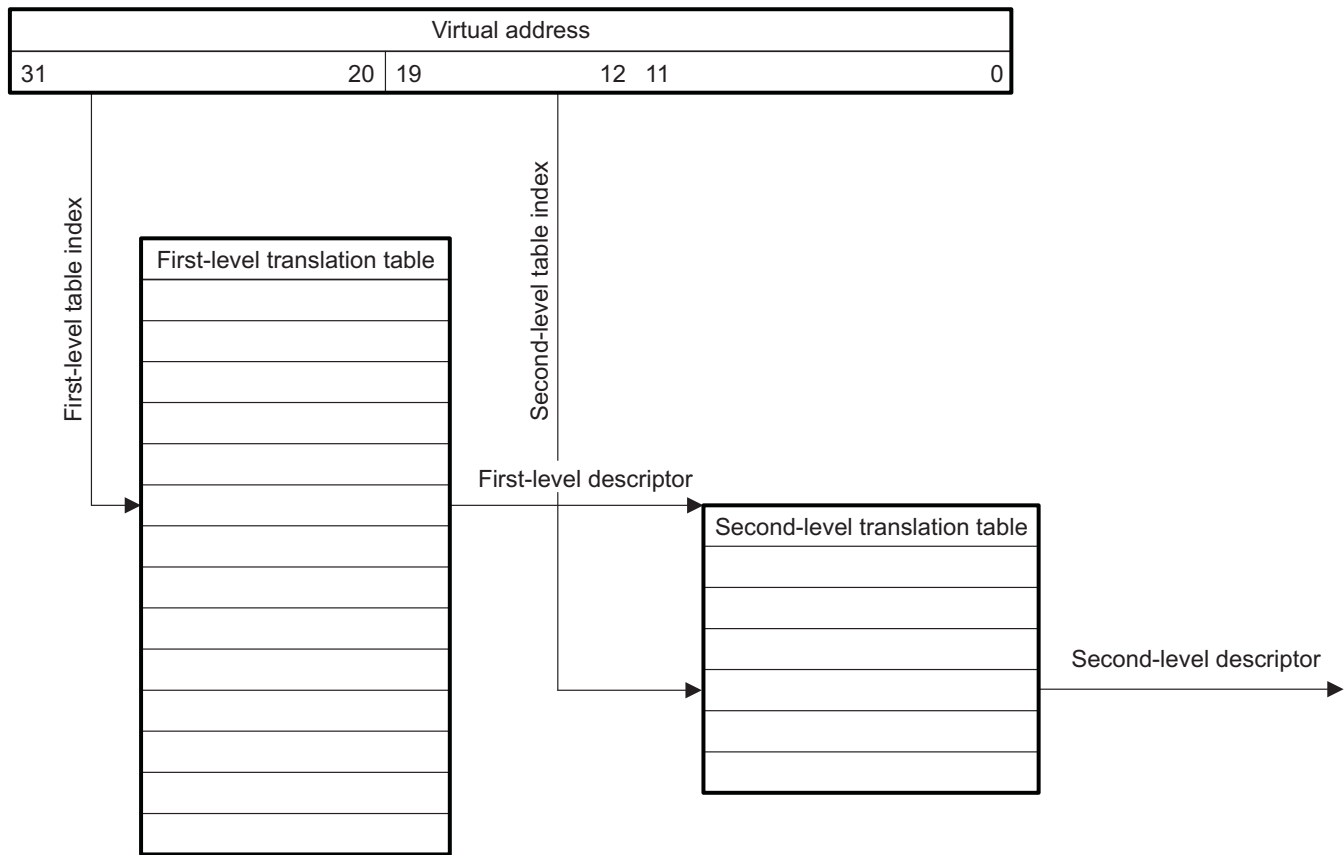

mmu-012

20.3.1.2.3 Two-Level Translation

Two-level translation is used when fine-grain granularity is required, that is, when memory sections smaller than 1MB are needed. In this case, the first-level descriptor provides a pointer to the base address of a second-level translation table. This second-level table is indexed by bits 19 to 12 of the virtual address. Figure 20-11 shows this indexing mechanism.

Figure 20-11. Two-Level Translation

mmu-013

Each second-level translation table describes the translation of 1MB of address space in pages of 64KB (large page) or 4KB (small page). It consists of 256 second-level descriptors describing 4KB each.

NOTE: In the case of a large page, the same descriptor must be repeated 16 times. If an access points to a descriptor that is not initialized, the MMU will behave in an unpredictable way.

20.3.1.2.3.1 Second-Level Descriptor Format

Similar to first-level section descriptors, second-level descriptors provide all of the necessary information for the translation of a large or small page. Table 20-5 shows the format of second-level descriptors. The translation parameters (endianness, element size, and mixed region) have the same meaning as those for sections.

Table 20-5. Second-Level Descriptor Format

| Second-Level Descriptor Format | | | | | | | | | | | |
|--------------------------------|-------|----|----|------------------|-----|-----|-----|---|---|------------|-------|
| 31:16 | 15:12 | 11 | 10 | 9 | 8:6 | 5:4 | 3:2 | 1 | 0 | | |
| X | | | | | | | | | 0 | 0 | Fault |
| Large Page Base Address | X | M | X | E ⁽¹⁾ | X | ES | X | 0 | 1 | Large Page | |
| Small Page Base Address | | M | X | E | X | ES | X | 1 | X | Small Page | |

⁽¹⁾ See for endianness limitations.

M = Mixed region: 0 = Page-based endianness, 1 = Access-based endianness

E = Endianness: 0 = Little-endian, 1 = Big-endian (endianness is locked on little endian)

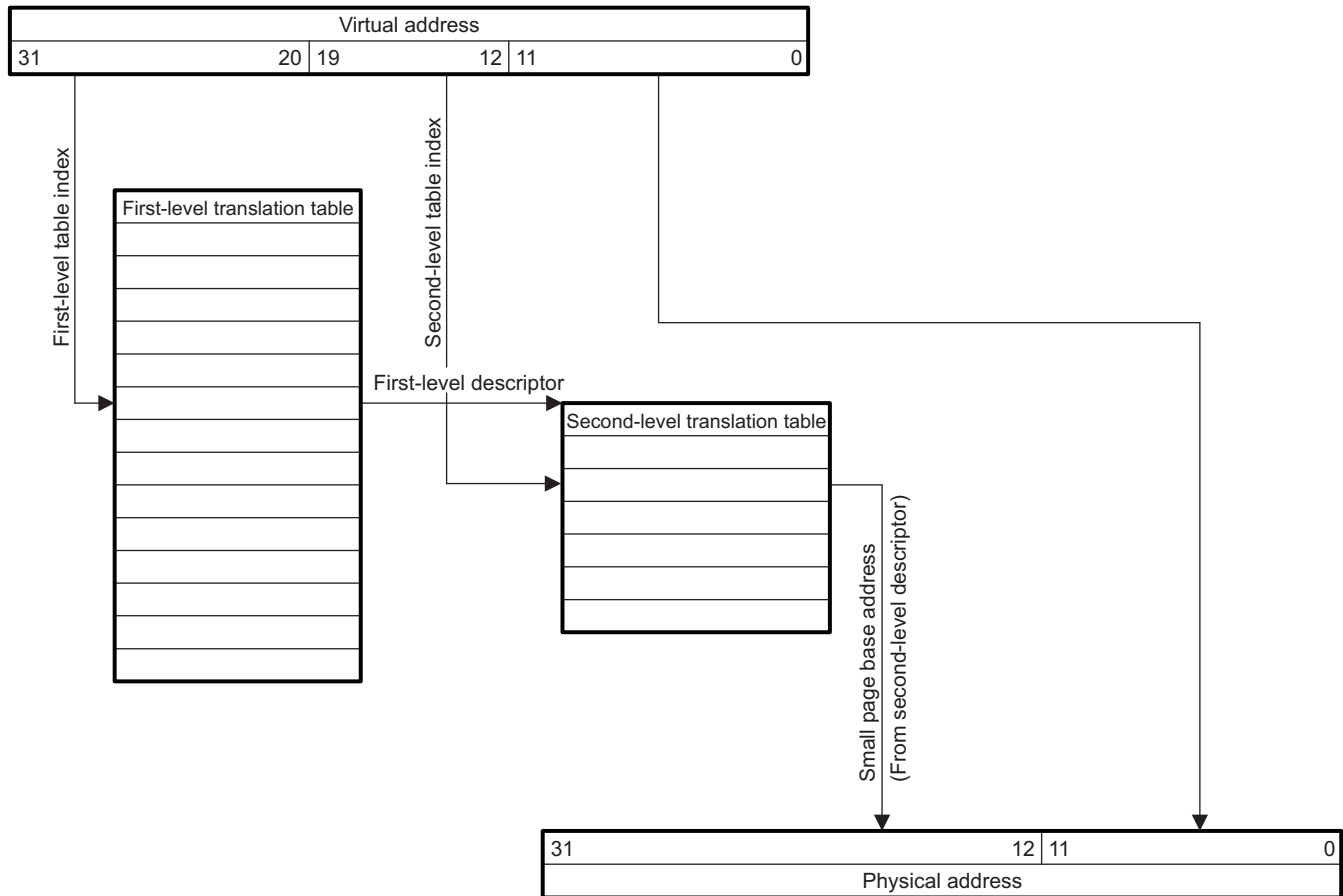

ES = Element Size: 00 = 8-bit, 01 = 16-bit, 10 = 32-bit, 11 = No endianness conversion

X = Don't care

20.3.1.2.3.2 Small Page Translation Summary

Figure 20-12 summarizes the translation process for small pages.

Figure 20-12. Small Page Translation Summary

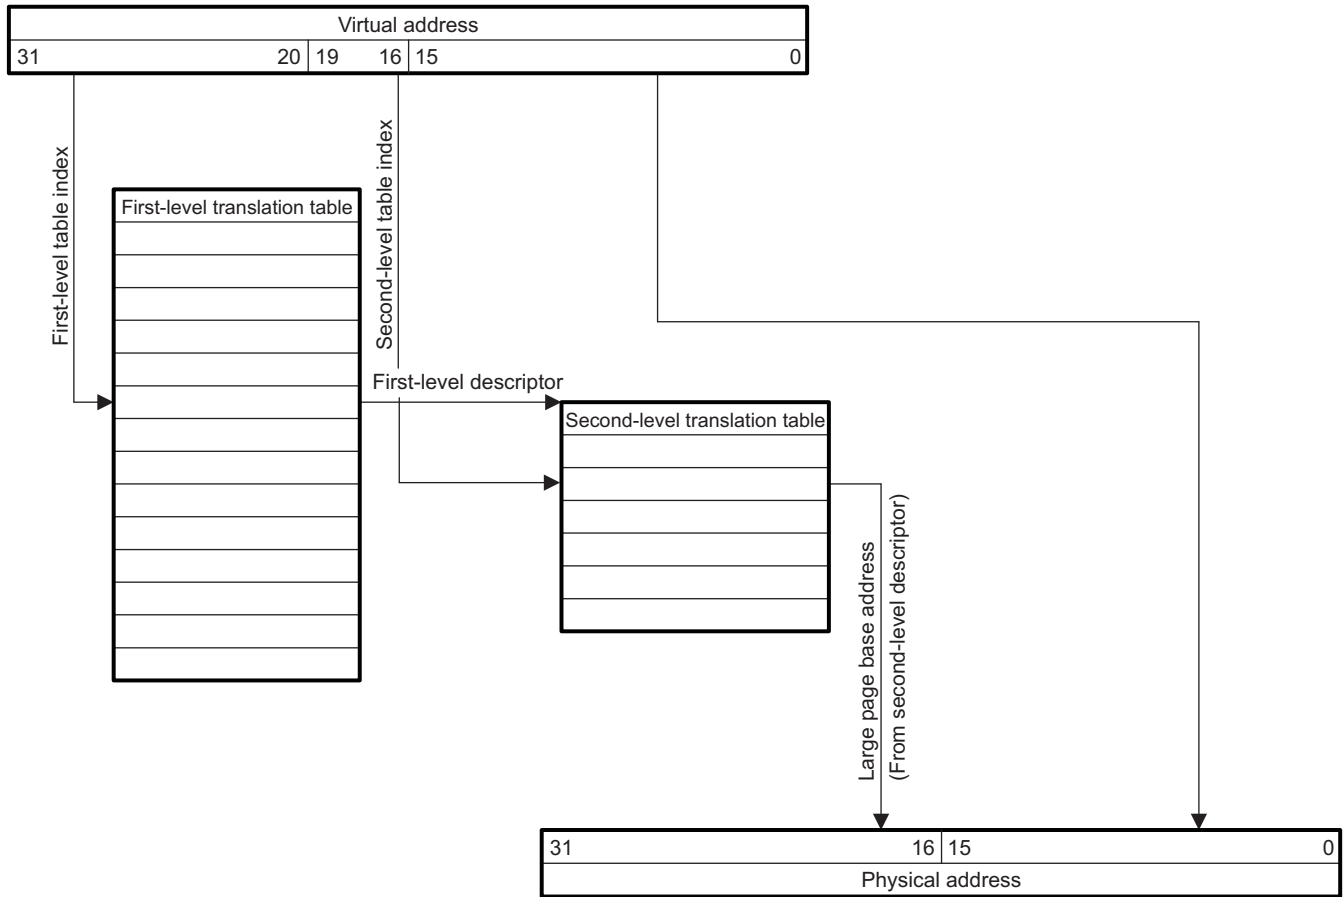

mmu-014

20.3.1.2.3.3 Large Page Translation Summary

The translation of a large page is similar to the translation of a small page. The difference is that, for a large page, only bits 19 to 16 index into the second-level translation table. The last four bits of the table index are implicitly assumed to be zero as there are 16 identical consecutive entries for a large page. This is shown in Figure 20-13.

Figure 20-13. Large Page Translation Summary

mmu-015

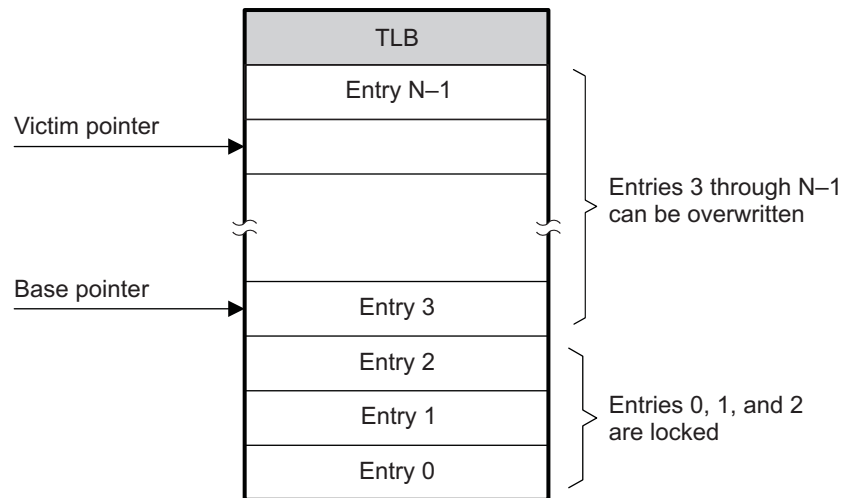

20.3.1.3 Translation Lookaside Buffer

Translating virtual addresses to physical addresses is required for each memory access in systems using an MMU. To accelerate this translation process, a cache, or TLB, holds the result of recent translations.

For every translation, the MMU internal logic first checks whether the requested translation is already cached in the TLB. If the translation is cached, this translation is used; otherwise the translation is retrieved from the translation tables and the TLB is updated. If the TLB is full, one of its entries must be replaced. This entry is selected on a random basis.

The first n TLB entries, where $n < Total\ Number\ N\ of\ TLB\ Entries$, can be protected (locked) against being overwritten by setting the TLB base pointer to n . When this mechanism is used, only unprotected entries can be overwritten. The victim pointer indicates the next TLB entry to be written. Figure 20-14 shows an example of the TLB with N TLB entries (ranging from 0 to $N-1$). The base pointer contains the value "3" protecting Entry 0, Entry 1, and Entry 2 and the victim pointer points to the next TLB entry to be updated.

NOTE: The last TLB entry (Entry $N-1$) always remains unprotected.

Figure 20-14. TLB Entry Lock Mechanism

mmu-016

The table walking logic automatically writes the TLB entries. The entries can also be manually written, which is done typically to ensure that the translation of time-critical data accesses is already present in the TLB so that they execute as fast as possible. The entries must be locked to prevent them from being overwritten.

20.3.1.3.1 TLB Entry Format

TLB entries consist of two parts:

- The CAM part contains the virtual address tag used to determine if a virtual address translation is in the TLB. The TLB acts like a fully associative cache addressed by the virtual address tag. The CAM part also contains the section/page size, as well as the preserved and the valid parameters. See the [MMU_CAM](#) register table for more details.
- The RAM part contains the address translation that belongs to the virtual address tag as well as the endianness, element size, and mixed parameters described in [Section 20.3.1.2.2, First-Level Translation Table](#). See the [MMU_RAM](#) register table for more details.

The valid parameter specifies whether an entry is valid or not. The preserved parameter determines the behavior of an entry in the event of a TLB flush. If an entry is set as preserved, it is not deleted when a TLB is flushed, that is, when [MMU_GFLUSH\[0\] GLOBALFLUSH](#) is set to 1. Preserved entries must be deleted manually. [Section 20.3.1.2.2](#) describes the procedure to delete TLB entries.

[Figure 20-16](#) shows the TLB entry structure.

Figure 20-15. TLB Entry Structure

mmu-017

20.3.2 MMU Clock Configuration

There are two clock domains: The functional clock domain for the MMU, which is synchronous to the clock for the interconnect slave and master access ports; and the clock domain for the interconnect slave configuration port. As these clocks are matched, there is a single input clock with enables for each of the clock domains. If a clock domain should run at the same frequency as the input clock, that enable can be tied high.

Two clock enable signals exist, one to enable the interconnect data master and slave ports, and the other to enable the clock on the configuration L3 interconnect port. The clock signals are configured through the [MMU_SYSCONFIG](#) register. This is a system configuration register that controls the various parameters of the L3 interface.

20.3.3 MMU Software Reset

This section describes the software reset feature of the module. The MMU instances are reset together with their respective reset domains. See [Table 20-2](#) for information about the reset domains of the different MMU instances.

To perform a software reset, write 1 in the [MMU_SYSCONFIG\[1\]](#) SOFTRESET bit. The [MMU_SYSSTATUS\[0\]](#) RESETDONE bit indicates that the software reset is complete when its value is 1. When the software reset completes, the [MMU_SYSCONFIG\[1\]](#) SOFTRESET bit is automatically reset. The software must ensure that the software reset completes before doing MMU operations. When an MMU instance is released from reset, its TLB is empty and the MMU is disabled.

20.3.4 MMU Power Management

As part of the device system-wide power management scheme, each MMU instance supports a communication protocol with the PRCM module that allows the PRCM module to request an MMU instance to enter a low-power state. When the MMU instance acknowledges a low-power mode request from the PRCM module, the clock to the instance is gated off at the PRCM clock generator. Because the clock is disabled at the source, the low-power mode offers lower power consumption than the internal clock gating method in the local power management.

[Table 20-6](#) describes the power-management features available for the MMU modules.

NOTE:

- For information about source clock gating and sleep/wake-up transitions description, see [Section 3.1.1.1, Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).
- For descriptions of EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see [Section 3.1.1.2, Module Level Clock Management](#), in [Chapter 3, Power, Reset, and Clock Management](#).

Table 20-6. MMU Local Power Management Features

| Feature | Register |
|------------------|----------------------------------|
| Idle modes | MMU_SYSCONFIG[4:3] IDLEMODE |
| Clock activity | MMU_SYSCONFIG[9:8] CLOCKACTIVITY |
| Clock autogating | MMU_SYSCONFIG[0] AUTOIDLE |

NOTE: The MMU_SYSCONFIG[9:8] CLOCKACTIVITY bits are read only.

20.3.5 MMU Interrupt Requests

[Table 20-7](#) lists the event flags and their masks that can cause module interrupts.

Table 20-7. Events

| Event Flag | Event Mask | Synchrono us | Sensitivit y | Map to | Description |
|--------------------------------------|--------------------------------------|-----------------|-----------------|----------|------------------------------------------------------------------------------------------------------------------|
| MMU_IRQSTATUS[4] MULTIHITFAULT | MMU_IRQENABLE[4] MULTIHITFAULT | Yes | Level | M3_IRQ_0 | Error in the L2 MMU due to multiple matches in the TLB |
| MMU_IRQSTATUS[3] TABLEWALKFAULT | MMU_IRQENABLE[3] TABLEWALKFAULT | Yes | Level | M3_IRQ_0 | Error in the L2 MMU due to error response received during a Table Walk |
| MMU_IRQSTATUS[2] EMUMISS | MMU_IRQENABLE[2] EMUMISS | | | | For more information about emulation and debug features, see Chapter 28, On-Chip Debug Support . |
| MMU_IRQSTATUS[1] TRANSLATIONFAULT | MMU_IRQENABLE[1] TRANSLATIONFAULT | Yes | Level | M3_IRQ_0 | Error in the L2 MMU due to invalid descriptor in the translation tables (translation fault) |
| MMU_IRQSTATUS[0] TLBMISS | MMU_IRQENABLE[0] TLBMISS | Yes | Level | M3_IRQ_0 | Error in L2 MMU due to unrecoverable TLB miss (hardware TWL disabled) |

20.3.6 MMU Error Handling

[Table 20-8](#) summarizes the intended operation for real and potential error conditions.

Table 20-8. Error Handling

| Item | Condition | Action |
|------|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Table-walk read has an error response. | Treat generally the same as a translation fault, but set the TableWalkFault interrupt status bit to aid in diagnosis |
| 2 | MMU is disabled during table-walk. | Not permitted; can result in loss of the current transaction but must not deadlock the MMU. Avoid this condition by first disabling the table-walk logic and then polling the TWLRunning bit to ensure that no table walk is pending |
| 3 | MMU is disabled during an address translation. | Not permitted; can result in access to an unintended location, but must not deadlock MMU. This condition should be avoided by ensuring that no accesses are pending. |

Table 20-8. Error Handling (continued)

| Item | Condition | Action |
|-------------|----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| 4 | TLB is accessed during an address translation or a table walk. | Reading permitted; write should be done with care to ensure that the TLB is self-consistent at all times that a translation can occur. |
| 5 | TLB is flushed during address translation or a table walk. | Permitted; the flush is processed first, followed by the TWL update. |
| 6 | MMU is disabled while an interrupt is pending. | Not permitted; all pending interrupts should be processed before disabling the MMU. |

L3 Interconnect configuration port: Accesses to undecoded register addresses must not give an error response.

To protect against changes to the address translation between a READEX and the corresponding write or during a burst the following configuration operations are protected against writes during these processes:

- TLB update
- Global flush
- Flush entry
- MMU disable

The protection is implemented by stalling the configuration interconnect transaction until the write can proceed safely.

20.4 MMU Low-level Programming Models

This section covers the low-level hardware programming sequences for configuration and usage of the module.

20.4.1 Global Initialization

20.4.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the MMU module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the MMU. For more information, see Section [Section 20.2, MMU Module Integration](#).

Table 20-9. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| PRCM | Module interface and functional clocks must be enabled. For more information, see Chapter 3, Power, Reset, and Clock Management . |
| (optional) MPU INTC or DSP INTC or Cortex-M3 INTC | MPU, DSP, and Cortex-M3 interrupt controller configuration must be done to enable the interrupts from module. |
| Interconnect | For more information about the L3 interconnect configuration, see Section 13.2, L3 Interconnect . |

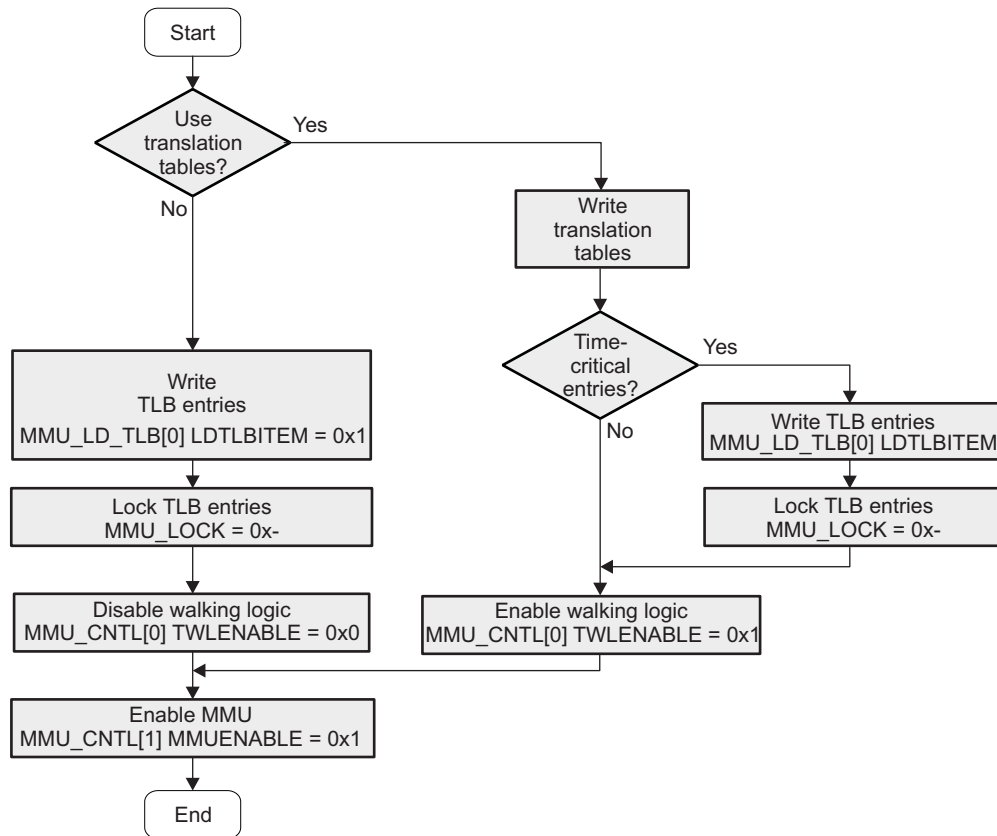

NOTE: If the interrupt-based communication mode is used, the MPU, DSP, and Cortex-M3 interrupt controllers configurations are required.

20.4.1.2 MMU Global Initialization

20.4.1.2.1 Main Sequence—MMU Global Initialization

[Figure 20-16](#) shows the procedure to initialize the MMU after a power-on or software reset.

Figure 20-16. MMU Global Initialization

mmu-018

Table 20-10. Register Call Summary for Main Sequence—MMU Global Initialization

| Register Name | Register Name | Register Name |
|---------------|---------------|---------------|
| MMU_LD_TLB | MMU_LOCK | MMU_CNTL |

20.4.1.2.2 Subsequence—Configure a TLB entry

Table 20-11. Configure a TLB Entry

| Step | Register / Bit Field / Programming Model | Value |
|-------------------------------------|------------------------------------------|-------|
| Load the Virtual Address Tag | MMU_CAM[31:12] VATAG | 0x- |
| Protect the TLB entry against flush | MMU_CAM[3] P | 0x1 |
| Validate the TLB entry | MMU_CAM[2] V | 0x1 |
| Define the page size | MMU_CAM[1:0] PAGESIZE | 0x- |

20.4.1.3 Operational Modes Configuration

20.4.1.3.1 Main Sequence—Writing TLB Entries Statically

Writing TLB entries statically avoids the need to write translation tables in memory and is commonly used for relatively small address spaces. This method ensures that the translation of time-critical data accesses execute as fast as possible with entries already present in the TLB. These entries must be locked to prevent them from being overwritten.

Table 20-12. MMU Writing TLB Entries Statically

| Step | Register/ Bit Field / Programming Model | Value |
|-----------------------------------------------------------------|-----------------------------------------|-------|
| Execute software reset | MMU_SYSCONFIG[1] SOFTRESET | 0x1 |
| Wait for reset to complete | MMU_SYSSTATUS[0] RESETDONE | =0x1 |
| Enable power saving via automatic interface clock gating | MMU_SYSCONFIG[0] AUTOIDLE | 0x1 |
| Configure TLB entries | See Table 20-11 | |
| Load the physical Address of the page | MMU_RAM[31:12] PHYSICALADDRESS | 0x- |
| Define the endianness of the page (little endian or big endian) | MMU_RAM[9] ENDIANNES | 0x- |
| Select the element size | MMU_RAM[8:7] ELEMENTSIZE | 0x- |
| Define mixed page attribute | MMU_RAM[6] MIXED | 0x- |
| Specify the TLB entry you want to write | MMU_LOCK[8:4] CURRENTVICTIM | 0x- |
| Load the specified entry in the TLB | MMU_LD_TLB[0] LDTLBITEM | 0x1 |
| Enable multihit fault and TLB miss | MMU_IRQENABLE[4] MULTIHITFAULT | 0x1 |
| | MMU_IRQENABLE[0] TLBMISS | 0x1 |
| Enable memory translations | MMU_CNTL[1] MMUENABLE | 0x1 |

20.4.1.3.2 Main Sequence—Protecting TLB Entries

The first n TLB entries (with $n <$ total number of TLB entries) can be protected from being overwritten with new translations. This is useful to ensure that certain commonly used or time-critical translations are always in the TLB and do not require retrieval using the table walking process.

Table 20-13. Protecting TLB Entries

| Step | Register/Bit Field/Programming Model | Value |
|-----------------------|--------------------------------------|-------|
| Locks the TLB entries | MMU_LOCK[14:10] BASEVALUE | 0x- |

20.4.1.3.3 Main Sequence—Deleting TLB Entries

Two mechanisms exist to delete TLB entries. All unpreserved TLB entries, that is, TLB entries written with the preserved bit set to zero, can be deleted by invoking a TLB flush. The preserved bit should only be used on protected TLB entries, as it does not prevent replacement by the table walking logic.

Table 20-14. Deleting TLB Entries

| Step | Register / Bit Field / Programming Model | Value |
|-----------------------------------------------------|------------------------------------------|-------|
| Flush all nonprotected TLB entries | MMU_GFLUSH[0] GLOBALFLUSH | 0x1 |
| Flush all TLB entries specified by the CAM register | MMU_FLUSH_ENTRY[0] FLUSHENTRY | 0x1 |

20.4.1.3.4 Main Sequence—Read TLB Entries

TLB entries can be read by the programmer to determine the TLB content at runtime.

Table 20-15. Read TLB Entries

| Step | Register / Bit Field / Programming Model | Value |
|---------------------------------|------------------------------------------|-------|
| Set the current victim pointer | MMU_LOCK[8:4] CURRENTVICTIM | 0x- |
| Read RAM parts of the TLB entry | MMU_READ_RAM | |
| Read CAM parts of the TLB entry | MMU_READ_CAM | |

Spinlock

This chapter describes the Spinlock module of the device.

| Topic | Page |
|---------------------------------------------------|-------------|
| 21.1 Spinlock Overview | 4372 |
| 21.2 Spinlock Integration | 4373 |
| 21.3 Spinlock Functional Description | 4374 |
| 21.4 Spinlock Programming Guide | 4377 |
| 21.5 Spinlock Register Manual | 4380 |

21.1 Spinlock Overview

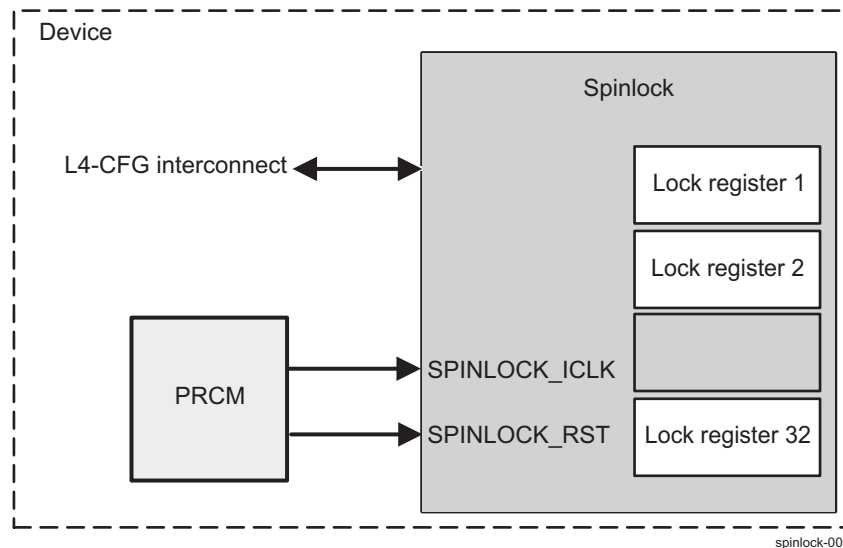

The Spinlock module provides hardware assistance for synchronizing the processes running on multiple processors in the device:

- Cortex-A9 microprocessor unit (MPU) subsystem
- Digital signal processor (DSP) subsystem
- Cortex-M3 MPU subsystem

The Spinlock module implements 32 spinlocks (or hardware semaphores), which provide an efficient way to perform a lock operation of a device resource using a single read-access, avoiding the need of a read-modify-write bus transfer that the programmable cores are not capable of.

Figure 21-1 shows the Spinlock module.

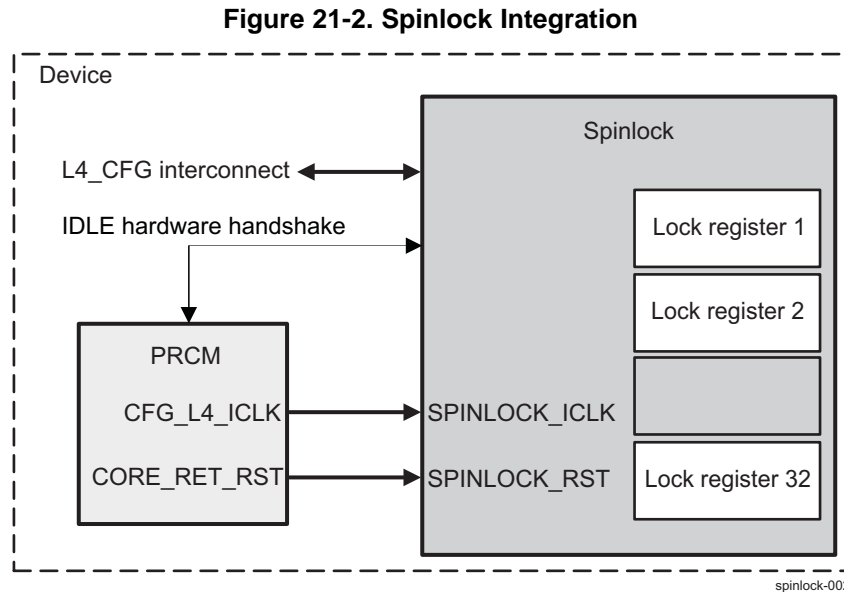

Figure 21-1. Spinlock Module

21.2 Spinlock Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

Figure 21-2 shows the Spinlock integration.

NOTE: For more information about the IDLE hardware handshake and the wake-up request, see [Section 3.1.1.1.2, Module Level Clock Management, Chapter 3, Power, Reset, and Clock Management](#).

Table 21-1 and Table 21-2 summarize the integration of the module in the device.

Table 21-1. Integration Attributes

| Module Instance | Attributes | |
|-----------------|--------------|--------------|
| | Power Domain | Interconnect |
| SPINLOCK | PD_CORE | L4_CFG |

Table 21-2. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|---------------------------------------------------------------------------------------------------|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| SPINLOCK | SPINLOCK_ICLK | CFG_L4_ICLK | PRCM | Spinlock interface clock. This clock is used for all interface and functional operations. |
| Resets | | | | |
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| SPINLOCK | SPINLOCK_RST | CORE_RET_RST | PRCM | Spinlock hardware reset. This reset is asynchronously applied to the Spinlock internal registers. |

The Spinlock module does not support any interrupt and DMA requests.

21.3 Spinlock Functional Description

21.3.1 Spinlock Software Reset

The Spinlock module can be reset by software through the `SPINLOCK_SYSCONFIG[1]` `SOFTRESET` bit. Setting this bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. The `SPINLOCK_SYSTATUS[0]` `RESETDONE` bit can be polled to check the reset status (reading 1 indicates that reset sequence is done; reading 0 indicates that reset sequence is in progress). The software must ensure that the software reset completes before doing Spinlock operations.

21.3.2 Spinlock Power Management

Table 21-3 describes power-management features available to the Spinlock module.

NOTE:

- For information about source clock gating and sleep/wake-up transitions description, see [Section 3.1.1.1.4, Clock Domain Level Clock Management, Chapter 3, Power, Reset, and Clock Management](#).
- For descriptions of `EnaWakeUp`, `IdleMode`, `ClockActivity`, and `StandbyMode` features, see [Section 3.1.1.1.2, Module Level Clock Management, Chapter 3, Power, Reset, and Clock Management](#).

Table 21-3. Local Power Management Features

| Feature | Registers | Description |
|-----------------------|--------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Clock auto gating | <code>SPINLOCK_SYSCONFIG[0]</code> <code>AUTOGATING</code> bit | This bit indicates that the module uses an automatic internal interface clock gating strategy, based on interface activity. |
| Slave idle modes | <code>SPINLOCK_SYSCONFIG[4:3]</code> <code>SIDLEMODE</code> bit field | This bit field indicates that the module uses smart-idle mode. |
| Clock activity | <code>SPINLOCK_SYSCONFIG[8]</code> <code>CLOCKACTIVITY</code> bit | This bit indicates that the interface clock is not required by the module during idle mode and may be switched off. |
| Global wake-up enable | <code>SPINLOCK_SYSCONFIG[2]</code> <code>ENAWAKEUP</code> bit | This bit indicates that the wake-up generation feature (at module level) is disabled. |

NOTE: All the local power management features are non-configurable (that is, their respective bits or bit fields are read-only).

CAUTION

The PRCM module has no hardware means of reading `CLOCKACTIVITY` settings. Thus, software must ensure consistent programming between the `CLOCKACTIVITY` bit and Spinlock clock PRCM control bits.

The Spinlock module is normally idle, except when processing a request from its slave interface port. The smart-idle mode acknowledges idle requests from the PRCM only when the module is prepared to go idle. The Spinlock module is always ready to go idle if it does not have any request that it is processing.

The Spinlock module uses retention flops to retain state including the Taken state of each lock register. This means that the module can be placed in retention at any time when it is not processing a request and it is known that the system will not need to access the module.

Software must ensure to only power off the Spinlock module when no locks would be lost. In general, the steps to powering down the Spinlock module are:

- Check that all masters which might use the Spinlock module are either:
 - (a) Already powered off, or
 - (b) Notified that Spinlock is not available and the notification is acknowledged.

- If desired, check that no locks are currently held in the Spinlock module. The status of each bank of 32 locks can be read from the [SPINLOCK_SYSTATUS](#) register. If any locks are held, they are orphaned because they are not held by any master that is still active. Alternatively, you may decide to wait a timeout period to allow any active master to clean up its locks before powering down.
- The Spinlock module can now be powered off by writing the appropriate status to the PRCM.

In the case of powering off the whole system, these steps are unnecessary.

21.3.3 About Spinlocks

Spinlocks are present to solve the need for synchronization and mutual exclusion between heterogeneous processors and those not operating under a single, shared operating system. There is no alternative mechanism to accomplish these operations between processors in separate subsystems.

Spinlocks are not the best way to synchronize between tasks or threads on one CPU. Instead, spinlocks are for use in synchronization between different subsystems in the device that don't have any other means of hardware-based synchronization.

Spinlocks do not solve all system synchronization issues. They have limited applicability and should be used with care to implement higher level synchronization protocols.

A spinlock is appropriate for mutual exclusion for access to a shared data structure. It should be used only when:

1. The time to hold the lock is predictable and small (for example, a maximum hold time of less than 200 CPU cycles may be acceptable).
2. The locking task cannot be preempted, suspended, or interrupted while holding the lock (this would make the hold time large and unpredictable).
3. The lock is lightly contended, that is the chance of any other process (or processor) trying to acquire the lock while it is held is small.

If these conditions are met, then the locking code can retry a failed attempt to acquire the lock until success.

If the conditions are not met, then a spinlock is not a good candidate. One alternative is to use a spinlock for critical section control (engineered to meet the conditions) to implement a higher level semaphore that can support preemption, notification, timeout or other higher level properties.

21.3.4 Spinlock Functional Operation

The Spinlock module supports 32 spinlocks. It accepts only a single command at a time and processes the command fully before accepting the next command. A lock is requested by reading the [SPINLOCK_LOCK_REG_i\[0\]](#) TAKEN bit. There are two states: Taken ([SPINLOCK_LOCK_REG_i\[0\]](#) TAKEN = 1) or Not Taken ([SPINLOCK_LOCK_REG_i\[0\]](#) TAKEN = 0).

When the status of lock *i* (where *i* = 0 to 31) is Not Taken (free), a read from the [SPINLOCK_LOCK_REG_i](#) register returns 0 and sets the lock to Taken (locked). When the status of lock *i* is Taken, a read returns 1 and does not change the state of the lock.

A write to the [SPINLOCK_LOCK_REG_i](#) register does not change the state of lock, unless when writing 0 when the lock is in Taken state. By doing this, the requester frees the lock.

CAUTION

Only 32-bit reads and writes are supported.

Figure 21-3 shows the [SPINLOCK_LOCK_REG_i](#) register state diagram.

Figure 21-3. Lock Register State Diagram

**NOTE:**

- There is no support to ensure that a lock register is locked and unlocked by the same process. This must be ensured in software.
- There is no support to check that the same initiator that acquired the lock is the one that is freeing the lock.

21.4 Spinlock Programming Guide

21.4.1 Spinlock Low-level Programming Models

This section covers the low-level hardware programming sequences for configuration and usage of the module.

21.4.1.1 Surrounding Modules Global Initialization

This procedure initializes the surrounding modules when the Spinlock module is used for the first time after a device reset.

Table 21-4. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRCM | Spinlock interface clock must be enabled. For more information, see Section 3.6.15 , <i>CD_L4_CFG Clock Domain</i> , Chapter 3, Power, Reset, and Clock Management . |
| Interconnect | For more information about the L4-CFG interconnect configuration, see Section 13.3, L4 Interconnects . |

21.4.1.2 Basic Spinlock Operations

The main spinlock operations are:

- Clear all the Taken spinlocks (only after a system bug recovery)
- Take a spinlock
- Release spinlock

21.4.1.2.1 Spinlocks Clearing After a System Bug Recovery

Module initialization (after reset) is not needed, except after system bug recovery. The following table presents the Spinlock initialization after a system bug recovery. Software should store 0 into each of the [SPINLOCK_LOCK_REG_i](#) registers at system startup to insure that all locks are initialized to Not Taken.

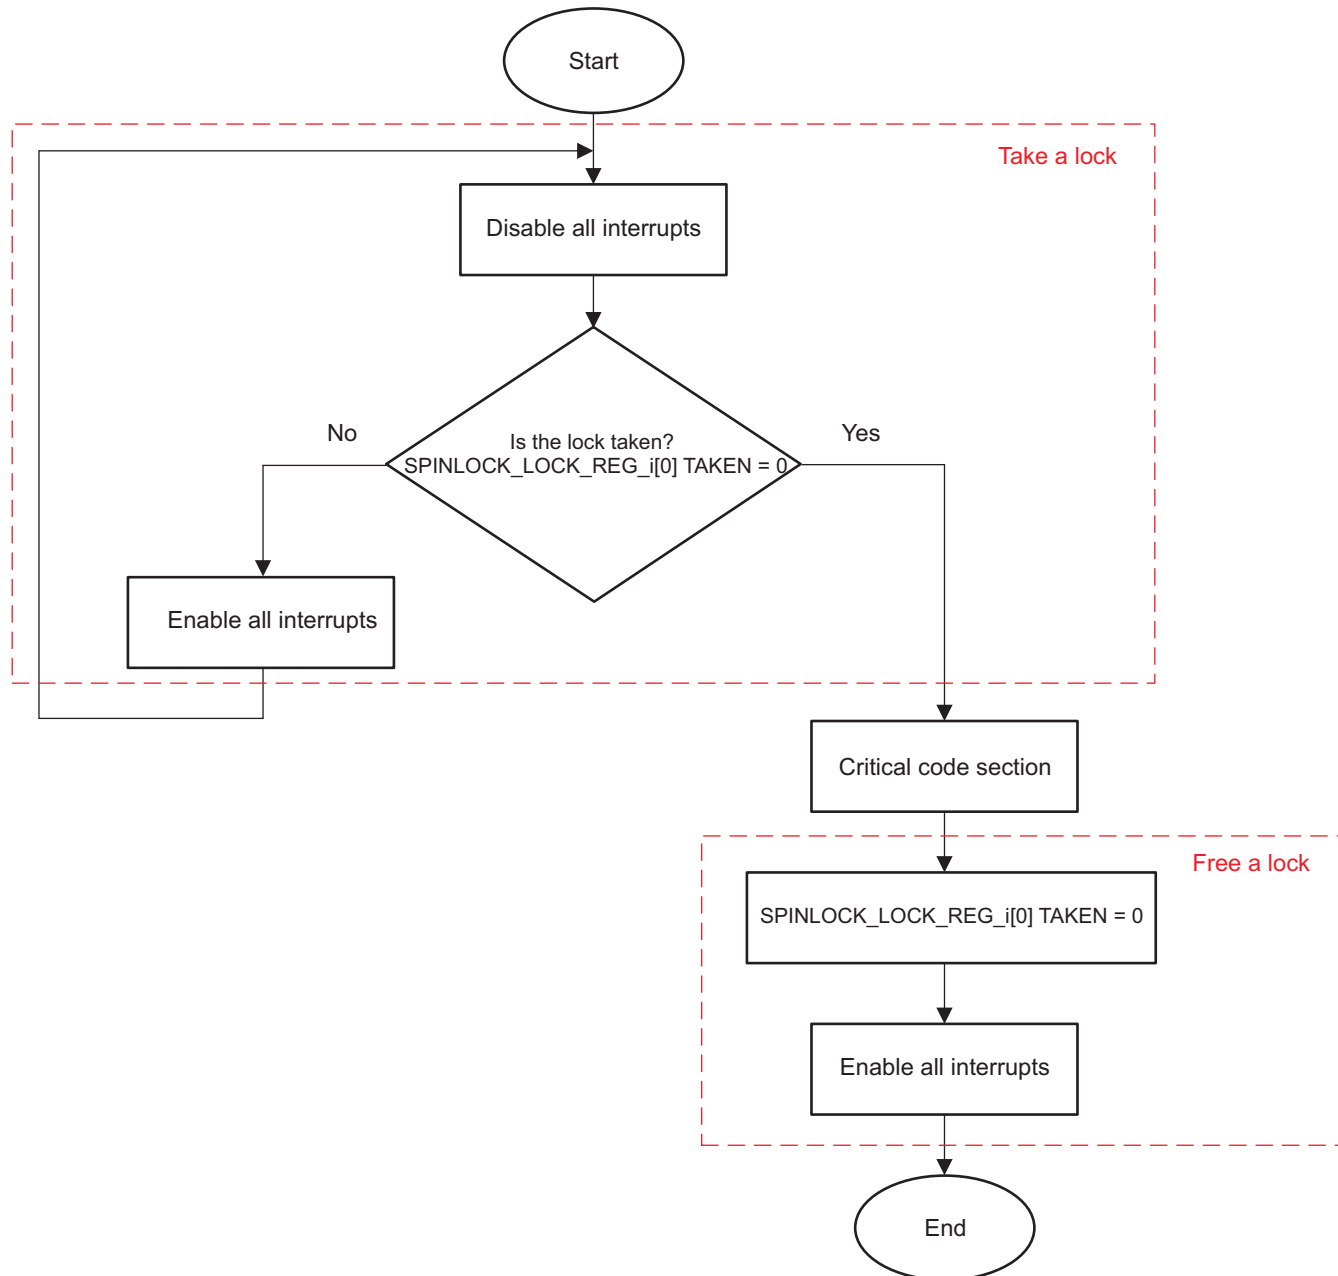

Table 21-5. Spinlock System Bug Recovery

| Step | Register | Value |
|-----------------------------------------------------|----------------------------------------------------------|-------|
| IF: SPINLOCK_SYSTATUS[0] IU0 = = 1? | SPINLOCK_SYSTATUS[0] IU0 | |
| Free the 32 locks | SPINLOCK_LOCK_REG_i[0] TAKEN (i=0 to 31) | 0x0 |
| END | | |

21.4.1.2.2 Take and Release Spinlock

This procedure configures the take and release (free) operations for the Spinlock module. A spinlock should only be held with interrupts disabled. So, before attempting to obtain the spinlock, software should disable interrupts. Then it should read the [SPINLOCK_LOCK_REG_i\[0\]](#) TAKEN bit to attempt to obtain the lock. If it succeeds, it should proceed directly through the critical section then unlock and re-enable interrupts. If the acquisition attempt fails, the acquisition should be reattempted. To prevent unknown interrupt disabled time, interrupts should be re-enabled and then disabled before reattempting to acquire the lock. [Figure 21-4](#) shows the described above procedure.

Timers

This chapter describes the timer modules for the device.

| Topic | Page |
|---------------------------------------------|-------------|
| 22.1 Timers Overview | 4385 |
| 22.2 General-Purpose Timers | 4386 |
| 22.3 Watchdog Timers | 4440 |
| 22.4 32-kHz Synchronized Timer | 4468 |

22.1 Timers Overview

The device includes several types of timers used by the system software, including 11 general-purpose (GP) timers, two watchdog timers, and a 32-kHz synchronized timer (sync timer). Figure 22-1 is a high-level block diagram of the device timers.

Figure 22-1. Timers

The two watchdog timers are clocked with 32-kHz clocks. The 32-kHz sync timer, which is reset only at power up, provides the operating system (OS) with a stable timing source that stores the relative time since the last power cycle of the product. Finally, 11 GP timers, which are useful simply as basic timers, are included to generate time-stamp-based interrupts to the system software or to use as a source of pulse-width modulation (PWM) signals.

22.2 General-Purpose Timers

22.2.1 General-Purpose Timers Overview

The device has 11 general-purpose (GP) timers: GPTIMER1 through GPTIMER11.

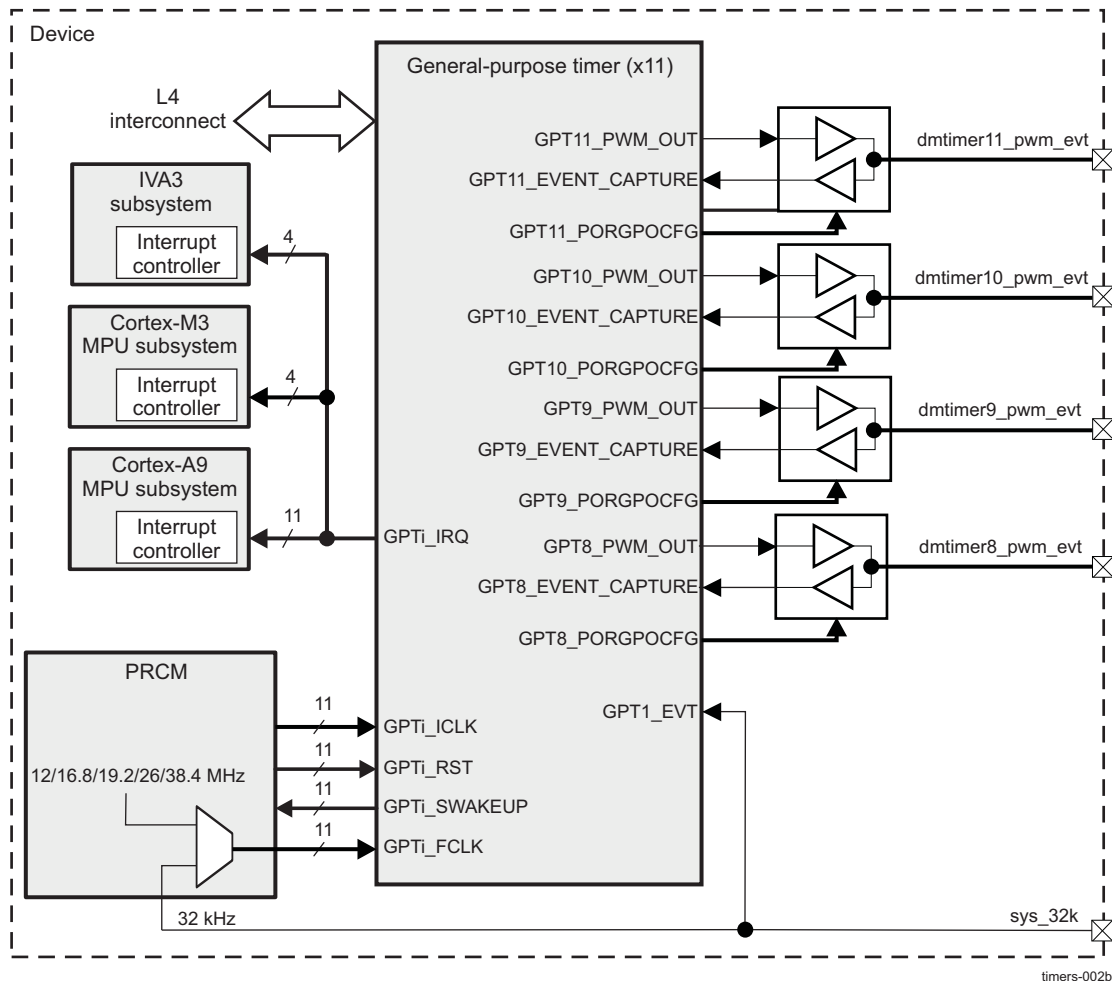

Each timer can be clocked from either the system clock (12, 16.8, 19.2, 26, or 38.4 MHz) or the 32-kHz clock. The selection of clock source is made at the power, reset, and clock management (PRCM) module level. For more information, see [Section 3.6.3.1, PRM Clock Source](#) in [Chapter 3, Power, Reset, and Clock Management](#).

GPTIMER1 has its GPT1_EVENT_CAPTURE pin tied to the 32-kHz clock and can be used to gauge the system clock input; it detects its frequency among 12, 16.8, 19.2, 26, or 38.4 MHz.

Each timer can provide an interrupt to the microprocessor unit (MPU) subsystem. In addition, GPTIMER5 through GPTIMER8 also have interrupts connected to the IVA3 subsystem.

GPTIMER1, GPTIMER2, and GPTIMER10 include specific functions to generate accurate tick interrupts to the operating system. GPTIMER8 through GPTIMER11 are connected to external pins by their PWM output or their event capture input pin (for external timer triggering). [Figure 22-2](#) is an overview of the GP timers.

Figure 22-2. GP Timers Overview

22.2.1.1 GP Timer Features

The following are the main features of the GP timer controllers:

- L4 slave interface support:

- 32-bit data bus width
- 32-/16-bit access supported
- 8-bit access not supported
- 10-bit address bus width
- Burst mode not supported
- Software-selectable nonposted or posted write/read internal resynchronization modes
- Interrupts generated on overflow, compare, and capture
- Free-running 32-bit upward counter
- Compare and capture modes
- Autoreload mode
- Start/stop mode
- Programmable divider clock source (2^n where $n = [0:8]$)
- Dedicated input trigger for capture mode and dedicated output trigger/PWM signal
- Dedicated GP output signal for using the GPTi_GPOCFG signal
- On-the-fly read/write register (while counting)
- 1-ms tick with 32,768-Hz functional clock generated (only GPTIMER1, GPTIMER2, and GPTIMER10)

22.2.2 GP Timer Environment

22.2.2.1 GP Timer External System Interface

Four of the 11 GP timers can send or receive stimulus to/from the external (off-chip) system. In the device; however, only GPTIMER8 through GPTIMER11 are configured to output a pulse-width modulation (PWM) pulse or receive an external event signal used as a trigger to capture the current timer count. GPTIMER1 is also configured to receive an event trigger input (GPT1_EVENT_CAPTURE) tied to the internal 32-kHz clock. This event signal gauges the system clock input; detecting its frequency among 12, 16.8, 19.2, 26, or 38.4 MHz.

Figure 22-3 shows the external system interface for the GP timers, and Table 22-1 describes the GP timer inputs and outputs.

NOTE: Software control must ensure that MUX mode is configured to select the `dmtimerx_pwm_evt` (where $x = 8$ to 11) signal on only one pad. Other pads on which the same signal is multiplexed must be configured in safe mode or non-dmtimer mode to avoid two different pads driving the same signal.

For more information about the configuration of the `dmtimer8_pwm_evt` through `dmtimer11_pwm_evt` I/O pads, see Section 18.4.8, *PAD Functional Multiplexing and Configuration*.

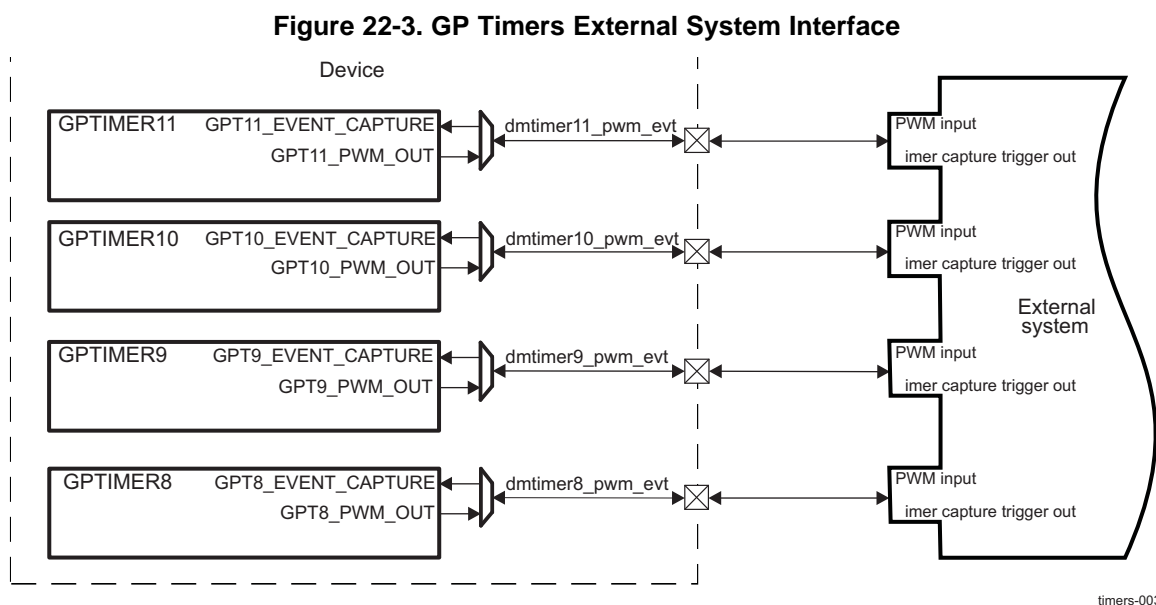

Table 22-1. Input/Output Description

| Pin Name | Type ⁽¹⁾ | Reset Value | Signal Name | Description |
|-------------------|---------------------|-------------|--------------------------------------|----------------------------------------|
| dmtimer8_pwm_evt | I/O | 0 | GPT8_EVENT_CAPTURE GPT8_PWM_OUT | GPTIMER8 trigger input/ PWM output |
| dmtimer9_pwm_evt | I/O | 0 | GPT9_EVENT_CAPTURE GPT9_PWM_OUT | GPTIMER9 trigger input/ PWM output |
| dmtimer10_pwm_evt | I/O | 0 | GPT10_EVENT_CAPTURE GPT10_PWM_OUT | GPTIMER10 trigger input/ PWM output |
| dmtimer11_pwm_evt | I/O | 0 | GPT11_EVENT_CAPTURE GPT11_PWM_OUT | GPTIMER11 trigger input/ PWM output |

⁽¹⁾ When configured for that function; I = input, O = output

NOTE: The event trigger input (GPTi_EVENT_CAPTURE) for GPTIMER2 through GPTIMER7 is internally tied low, and the PWM output (GPTi_PWM_OUT) is not connected.

NOTE: For GPTIMER8 through GPTIMER11, the GPTi_PORGPOCFG signal selects to connect the GPT pwm output or the GPT capture input to the dmtimerx_pwm_evt (where x = 8 to 11) pad at the top level. When the TCLR[14] GPO_CFG bit = 0b1, the dmtimerx_pwm_evt functions as a capture input. When the TCLR[14] GPO_CFG bit = 0b0, the dmtimerx_pwm_evt functions as a pwm output (GPO_CFG = 0b0).

22.2.3 GP Timer Integration

Figure 22-4 shows the integration of the GP timer in the device.

Figure 22-4. GP Timer Integration

Table 22-2 through Table 22-4 summarize the integration of the module in the device.

Table 22-2. Integration Attributes

| Module Instance | Attributes | | |
|-----------------|--------------|--------------------|--------------|
| | Power Domain | Wake-Up Capability | Interconnect |
| GPTIMER1 | PD_WKUP | Yes | L4_WKUP |

| No DMA Requests | | | | |

NOTE: For the description of the interrupt source description, see [Section 22.2.4.5, GP Timer Interrupts](#).

22.2.4 GP Timer Functional Description

Each GP timer contains a free-running upward counter with autoreload capability on overflow. The timer counter can be read and written on-the-fly (while counting). Each GP timer includes compare logic to allow an interrupt event on a programmable counter matching value. A dedicated output signal can be pulsed or toggled on either an overflow or a match event. This offers time-stamp trigger signaling or PWM signal sources. A dedicated input signal can be used to trigger an automatic timer counter capture or an interrupt event on a programmable input signal transition. A programmable clock divider (prescaler) allows reduction of the timer input clock frequency. All internal timer interrupt sources are merged into one module interrupt line and one wake-up line.

Each internal interrupt source can be independently enabled/disabled with a dedicated bit of the [GPT_TIER](#) register for the interrupt features, and a dedicated bit of the [GPT_TWER](#) register for the wake-up of GPTIMER1, GPTIMER2, and GPTIMER10. In addition, these timers have a mechanism implemented to generate an accurate tick interrupt.

For the other GP Timers, each internal interrupt source can be independently enabled/disabled through the [GPT_IRQENABLE_SET](#) and [GPT_IRQENABLE_CLR](#) register bit fields.

For each GP timer implemented in the device, there are two possible clock sources:

- 32-kHz clock
- System clock

Selection of the input clock source is done in the registers in the PRCM configuration (see [Section 22.2.1, GP Timer Overview](#)).

Each GP timer supports three functional modes:

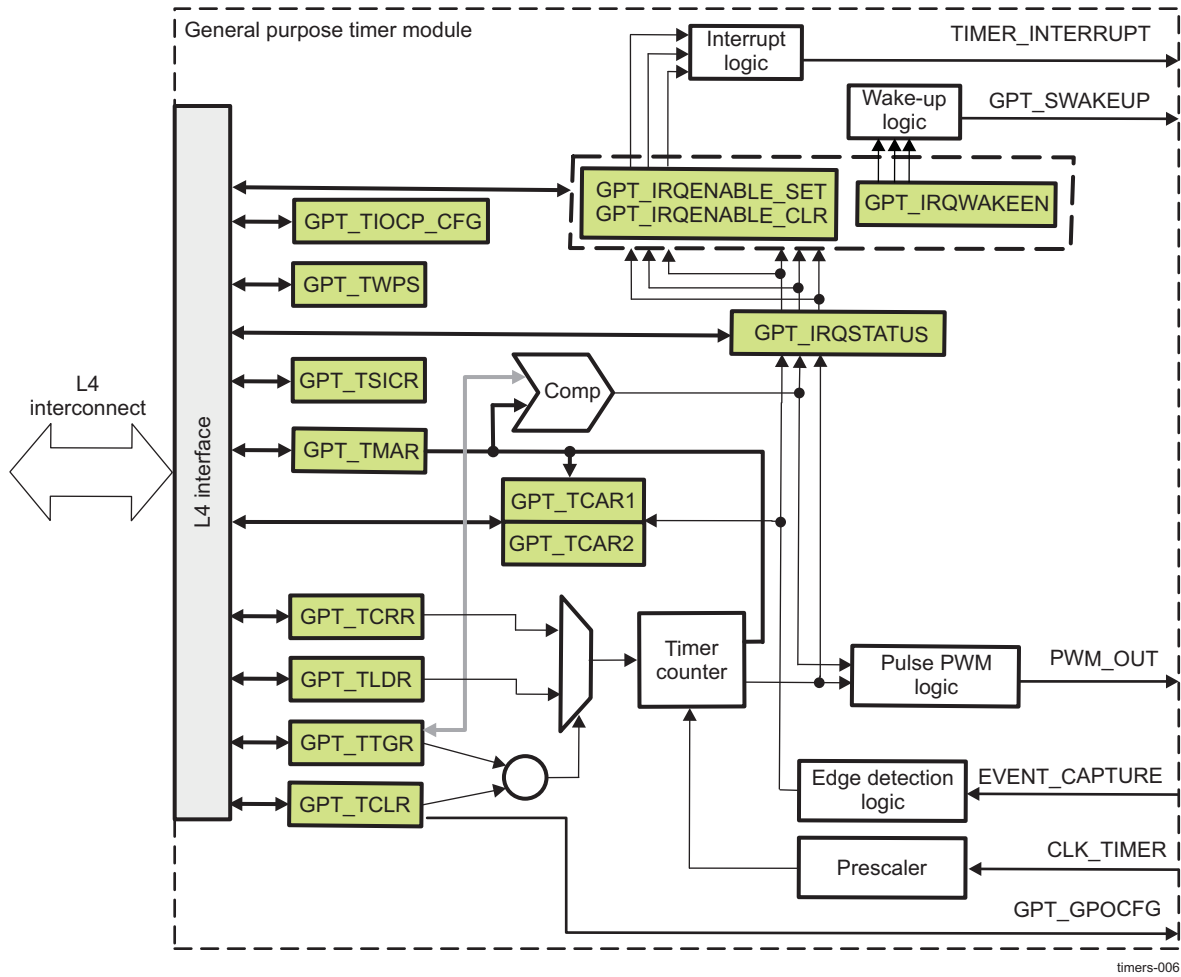

- Timer mode
- Capture mode
- Compare mode

The capture and compare modes are disabled by default after core reset.

22.2.4.1 GP Timer Block Diagram

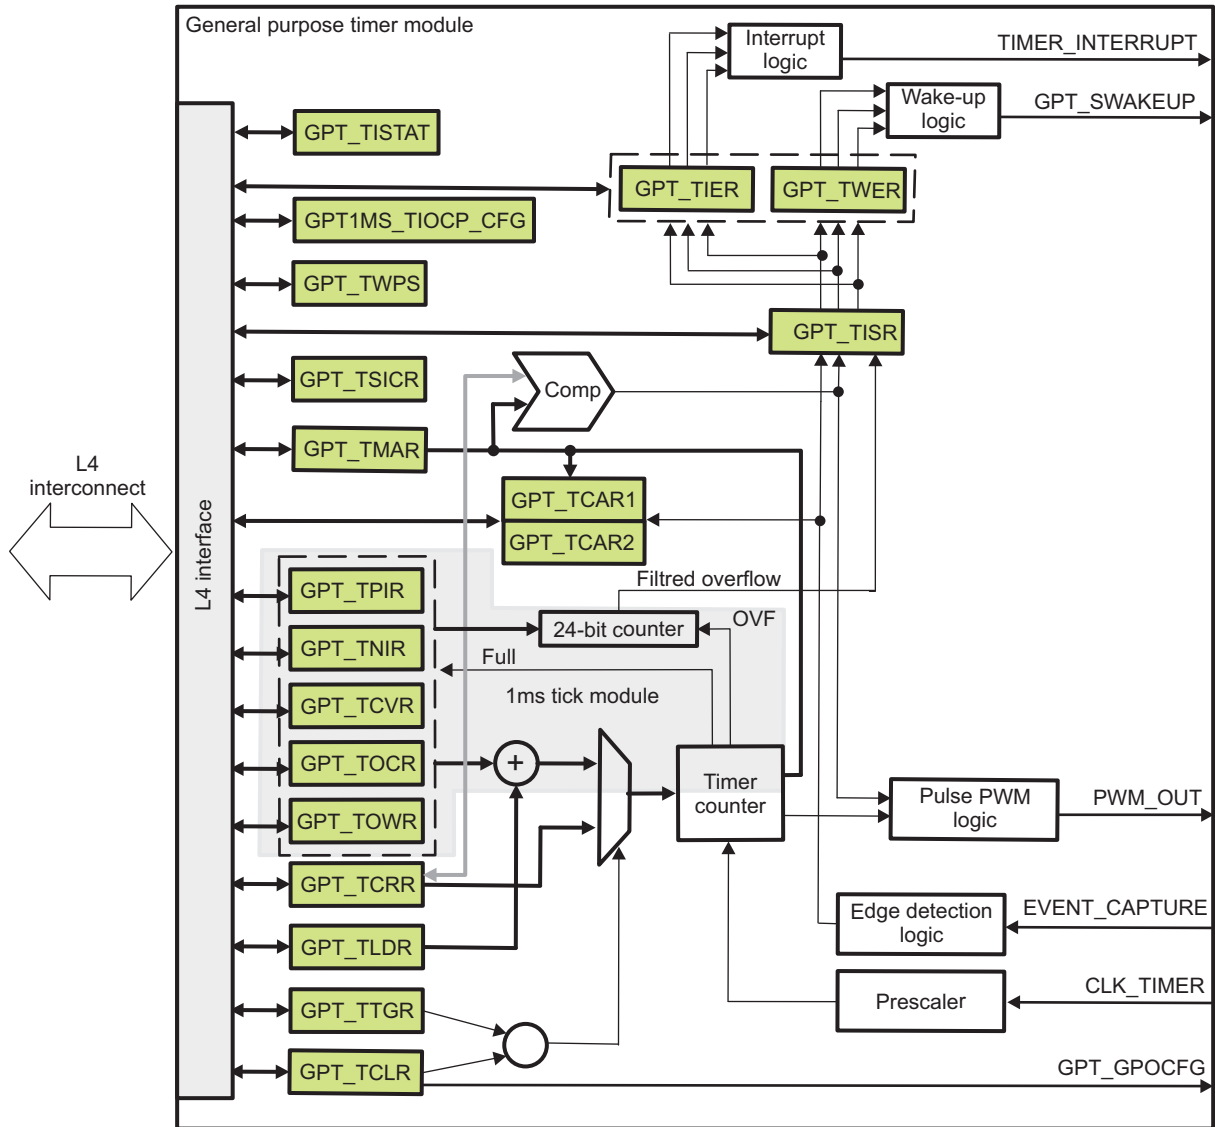

[Figure 22-5](#) is a block diagram of the common GP timers, and [Figure 22-6](#) is a block diagram of the GP timers with 1-ms tick generation module.

Figure 22-5. Block Diagram of GPTIMER3 Through GPTIMER9, and GPTIMER11

timers-006

Figure 22-6. Block Diagram of GPTIMER1, GPTIMER2, and GPTIMER10

timers-007

22.2.4.2 GPTIMER1, GPTIMER2, and GPTIMER10 Power Management

The GP timer modules have an internal bit, `GPT1MS_TIOCP_CFG[0]` AUTOIDLE, that is used to apply an internal interface clock gating strategy.

At the PRCM module level, when all conditions to shut off the PRCM module functional or interface output clocks are met (see [Section 3.1.1.1.4, Clock Domain-Level Clock Management](#)), the PRCM module automatically launches a hardware handshake protocol to ensure the GP timer is ready to have its clocks switched off. Namely, the PRCM module asserts an IDLE request to the GP timer.

Although this handshake is a hardware function and is out of software control, the way the GP timer acknowledges the PRCM IDLE request is configurable through the `GPT1MS_TIOCP_CFG[4:3]` IDLEMODE bit field.

[Table 22-7](#) lists the IDLEMODE settings and the related acknowledgment modes.

Table 22-5. IDLEMODE Settings

| IDLEMODE Value | Selected Mode | Description |
|----------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 00 | Force-idle | The GP timer unconditionally acknowledges the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully, because it does not prevent the loss of data when the clock is switched off. |
| 01 | No-idle | The GP timer never acknowledges an IDLE request from the PRCM module. This mode is safe from a module point of view, because it ensures that the clocks remain active. It is not efficient from a power-saving perspective, because it does not allow the PRCM output clock to be shut off and thus the power domain to be set to a lower power state. |
| 10 | Smart-idle | The GP timer acknowledges the IDLE request, basing its decision on its internal activity. The acknowledge signal is asserted only when all pending transactions and IRQ requests are treated. This is the best approach to efficient system power management. |
| 11 | Reserved | |

When configured in smart-idle mode, the GP timer also offers an additional granularity on `GPTi_FCLK` and `GPTi_ICLK` gating. The `GPT1MS_TIOCP_CFG[9:8]` CLOCKACTIVITY bit field is used to determine which clock is shut down (`GPTi_FCLK`, `GPTi_ICLK`, neither, or both clocks).

The CLOCKACTIVITY setting is used internally to the GP timer to determine the part of the module on which the conditions to acknowledge the PRCM IDLE request are tested. For example, if `GPTi_FCLK` is not to be shut down on a PRCM IDLE request, the GP timer considers only `GPTi_ICLK` and associated pending activities before acknowledging the request.

Some GP timer features are associated with `GPTi_ICLK` and others are associated with `GPTi_FCLK`. Using the CLOCKACTIVITY setting along with the smart-idle mode ensures that the features associated with the clock that remains active are always enabled, even if the GP timer acknowledges an IDLE request.

[Table 22-6](#) lists the CLOCKACTIVITY settings and associated features.

Table 22-6. CLOCKACTIVITY Settings

| CLOCKACTIVITY Value | GPTi_ICLK Effects | GPTi_FCLK Effects | Description | Associated Features |
|---------------------|-------------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 00 | OFF | OFF | <code>GPTi_ICLK</code> and <code>GPTi_FCLK</code> are considered for generating the acknowledge. This setting also means <code>GPTi_FCLK</code> and <code>GPTi_ICLK</code> are likely to be shut down on PRCM IDLE request. | The idle acknowledge signal is asserted when there are no pending activities on the functional clock domain (improved latency in assertion of idle acknowledge). The wake-up capability of the GP timer is disabled. |
| 01 | ON | OFF | <code>GPTi_ICLK</code> is not shut down on PRCM IDLE request; only <code>GPTi_FCLK</code> is affected. | |

Table 22-6. CLOCKACTIVITY Settings (continued)

| CLOCKACTIVITY Value | GPTi_ICLK Effects | GPTi_FCLK Effects | Description | Associated Features |
|---------------------|-------------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10 | OFF | ON | GPTi_FCLK is not shut down on PRCM IDLE request; only GPTi_ICLK is affected. | The idle acknowledge signal is asserted when there are no pending activities on the interface clock domain, without evaluating the pending activities on the functional clock domain (the GP timer enters into sleep mode, and if a pending interrupt event is completed during idle mode, the wake-up signal is asserted). The wake-up signal is enabled. |
| 11 | ON | ON | None of the clocks are shut down. Therefore, the GP timer can potentially acknowledge the IDLE request without checking the internal functionalities linked to its clocks. | |

CAUTION

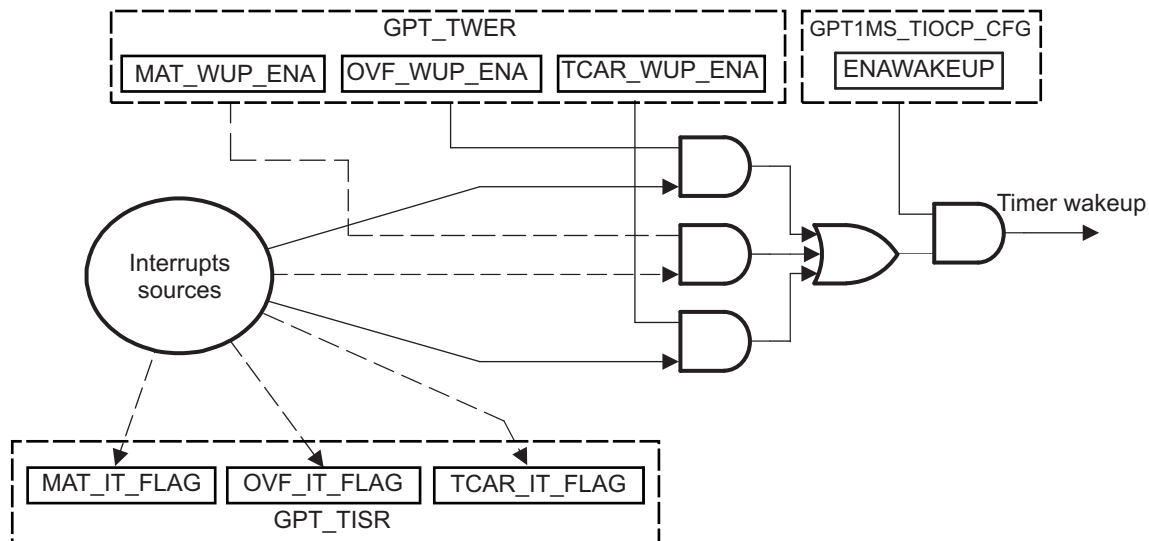

The PRCM module does not have any hardware means to read the CLOCKACTIVITY settings. The software must ensure consistent programming between the GP timer CLOCKACTIVITY and the PRCM module functional clock and interface clock control bits. If the GP timer is disabled in the CM_FCLKEN and CM_ICLKEN PRCM registers while CLOCKACTIVITY is set to 11, nothing prevents the PRCM module from asserting its IDLE request, which is acknowledged regardless of the features associated with the GP timer clocks. This can lead to unpredictable behavior.

22.2.4.2.1 Wake-Up Capability

If the GPT1MS_TIOCP_CFG[4:3] IDLEMODE bit field sets the smart-idle mode, the timer evaluates its internal capability to have the interface clock switched off. When there is no further internal activity (no pending interrupt sources: match, overflow, or timer capture events), the idle acknowledge signal is asserted and the timer enters sleep mode, ready to issue a wake-up request. This wake-up request is sent only if the GPT1MS_TIOCP_CFG[2] ENAWAKEUP bit enables the timer wake-up capability.

Figure 22-7 shows the wake-up request generation. For more information on the GP timer clock control, see Section 3.6, Clock Management Functional Description in Chapter 3, Power, Reset and Clock Management.

Figure 22-7. Wake-Up Request Generation

timers-005

For GPTIMER1, GPTIMER2, and GPTIMER10, the timer wake-up enable-register (**GPT_TWER**) allows masking the expected source of the wake-up event that generates a wake-up request. The **GPT_TWER** register is synchronously programmed with the interface clock before the PRCM module sends an idle mode request. The expected source of the wake-up event is an overflow (**GPT_TCRR**), a timer match (the compare result of **GPT_TCRR** and **GPT_TMAR** matches the counter value), and a timer capture (detection of an external pulse transition of the correct polarity on the **GPT_EVENT_CAPTURE**).

When the wake-up event is issued, the associated interrupt status bit is set in the timer status register (**GPT_TISR**). The pending wake-up event is reset when the set status bit is overwritten with 1.

NOTE: The status bit must be reset to re-enter idle mode.

22.2.4.3 Power Management of Other GP Timers

At the PRCM module level, when all conditions to shut off the PRCM module functional or interface output clocks are met (see [Section 3.1.1.1.4, Clock Domain Level Clock Management](#)), the PRCM module automatically launches a hardware handshake protocol to ensure the GP timer is ready to have its clocks switched off. Namely, the PRCM module asserts an IDLE request to the GP timer.

Although this handshake is a hardware function and is out of software control, the way the GP timer acknowledges the PRCM IDLE request is configurable through the **GPT_TIOCP_CFG**[3:2] IDLEMODE bit field.

[Table 22-7](#) lists the IDLEMODE settings and the related acknowledgment modes.

Table 22-7. IDLEMODE Settings

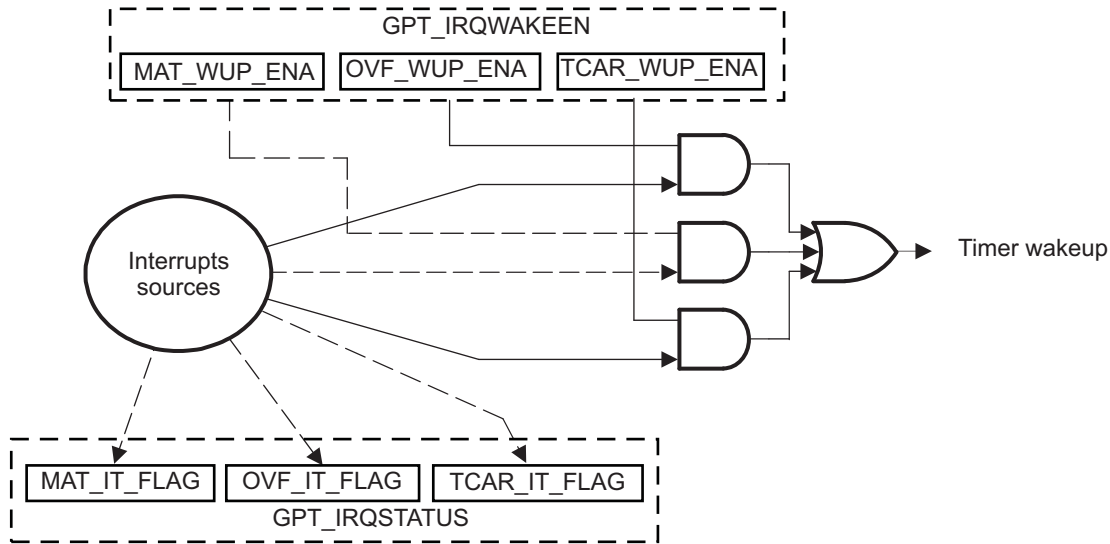

| IDLEMODE Value | Selected Mode | Description |
|----------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 00 | Force-idle | The GP timer unconditionally acknowledges the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully, because it does not prevent the loss of data when the clock is switched off. |
| 01 | No-idle | The GP timer never acknowledges an IDLE request from the PRCM module. This mode is safe from a module point of view, because it ensures that the clocks remain active. It is not efficient from a power-saving perspective, however, because it does not allow the PRCM output clock to be shut off and thus the power domain to be set to a lower power state. |
| 10 | Smart-idle | The GP timer acknowledges the IDLE request, basing its decision on its internal activity. The acknowledge signal is asserted only when all pending transactions and IRQ requests are treated. This is the best approach to efficient system power management. |
| 11 | Reserved | |

22.2.4.3.1 Wake-Up Capability

If the **GPT_TIOCP_CFG**[3:2] IDLEMODE bit field sets the smart-idle mode, the timer evaluates its internal capability to have the interface clock switched off. When there is no further internal activity (no pending interrupt sources: match, overflow, or timer capture events), the idle acknowledge signal is asserted and the timer enters sleep mode, ready to issue a wake-up request. This wake-up request is sent only if the **GPT_IRQWAKEEN**[2:0] bit field enables the timer wake-up capability.

[Figure 22-8](#) shows the wake-up request generation. For more information on the GP timer clock control, see [Section 3.6, Clock Management Functional Description](#) in [Chapter 3, Power, Reset and Clock Management](#).

Figure 22-8. Wake-Up Request Generation

timers-014

When the wake-up event is issued, the associated interrupt status bit is set in the timer status register ([GPT_IRQSTATUS](#)). The pending wake-up event is reset when the set status bit is overwritten with 1.

NOTE: The status bit must be reset to re-enter idle mode.

22.2.4.4 Software Reset

Two bit fields can generate a software reset of the GP timer:

- [GPT1MS_TIOCP_CFG\[1\]](#) SOFTRESET for GPTIMER1, GPTIMER2, and GPTIMER10, and [GPT_TIOCP_CFG\[0\]](#) SOFTRESET for other timers
- [GPT_TSICR\[1\]](#) SFT for all timers

For both bits, all read accesses return 0.

The [GPT1MS_TIOCP_CFG\[1\]](#) SOFTRESET/[GPT_TIOCP_CFG\[0\]](#) SOFTRESET bit allows resetting the functional and interface domains. The [GPT_TSICR\[1\]](#) SFT bit allows resetting the functional part of the GP timer.

Before accessing or using the GP timer, the local host must ensure that both internal resets are released by reading the [GPT_TISTAT\[0\]](#) RESETDONE (for GPTIMER1, GPTIMER2, and GPTIMER10), or the [GPT_TIOCP_CFG\[0\]](#) SOFTRESET bit (for other timers). This bit monitors the internal reset status.

22.2.4.5 GP Timer Interrupts

The timer can issue an overflow interrupt, a timer match interrupt, and a timer capture interrupt. Each internal interrupt source can be independently enabled/disabled in the interrupt-enable register ([GPT_TIER](#) for GPTIMER1, GPTIMER2, and GPTIMER10), or, for other timers, enable in the interrupt-enable register ([GPT_IRQENABLE_SET](#)) and disable in the interrupt disable register ([GPT_IRQENABLE_CLR](#)). When the interrupt event is issued, the associated interrupt status bit is set in the timer status register ([GPT_TISR](#) for GPTIMER1, GPTIMER2, and GPTIMER10, and [GPT_IRQSTATUS](#) for other timers).

22.2.4.6 Timer Mode Functionality

The timer is an upward counter that can be started and stopped at any time through the timer control register (`GPT_TCLR[0]` ST bit). The timer counter register (`GPT_TCRR`) can be loaded when stopped or on-the-fly (while counting). `GPT_TCRR` can be loaded directly by a `GPT_TCRR` write access with a new timer value. The `GPT_TCRR` register can also be loaded with the value held in the timer-load register `GPT_TLDR` by a trigger register (`GPT_TTGR`) write access. Loading of `GPT_TCRR` is done regardless of the `GPT_TTGR` written value. The timer counter register `GPT_TCRR` value can be read when stopped, or captured on-the-fly by a `GPT_TCRR` read access. The timer is stopped and the counter value is set to 0 when the module reset is asserted. The timer is maintained at stop after the reset is released.

In one-shot mode (the `GPT_TCLR[1]` AR bit set to 0), the counter is stopped after counting overflow occurs (the counter value remains at 0).

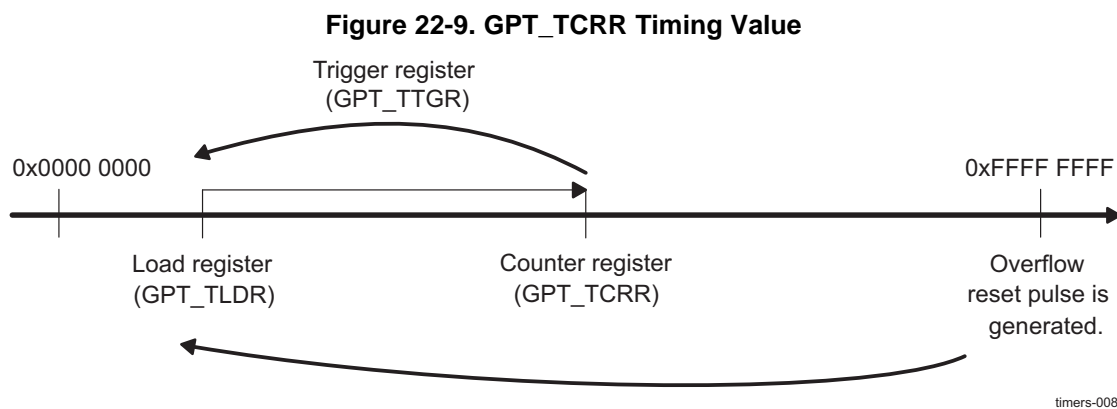

When the autoreload mode is enabled (the `GPT_TCLR[1]` AR bit set to 1), the `GPT_TCRR` register is reloaded with the timer-load register (`GPT_TLDR`) value after a counting overflow occurs.

CAUTION

Do not put the overflow value (0xFFFF FFFF) in the `GPT_TLDR` register because it can lead to undesirable results.

An interrupt can be issued on overflow if the overflow interrupt-enable bit is set in the timer interrupt-enable register (`GPT_TIER[1]` OVF_IT_ENA bit set to 1 for GPTIMER1, GPTIMER2, and GPTIMER10, or `GPT_IRQENABLE_SET[1]` OVF_IT_FLAG bit set to 1 for other timers). A dedicated output pin (timer PWM) can be programmed in `GPT_TCLR[12]` through `GPT_TCLR[11:10]` (PT and TRG bits) to generate one positive pulse (prescaler duration) or to invert the current value (toggle mode) when an overflow occurs. The `GPT_TCLR[12]` PT bit selects pulse/toggle modulation (`GPT_TCLR[11:10]` TRG bit field selects trigger mode).

Figure 22-9 shows the `GPT_TCRR` timing value.

22.2.4.6.1 1-ms Tick Generation (Only GPTIMER1, GPTIMER2, and GPTIMER10)

The interrupt period is not exactly 1 ms because the timer input clock is 32,768 Hz. If the clock counts up to 32, it obtains a 0.977-ms period; if it counts up to 33, it obtains a 1.007-ms period. For large granularity, the error is cumulative and can generate important deviations from the standard value.

To minimize the error between a true 1-ms tick and the tick generated by the 32,768 Hz timer, the sequencing of periods less than 1 ms and periods greater than 1 ms must be shuffled. An additional 1-ms block is used to correct this error. See Figure 22-10.

In this implementation, the increment sequencing is automatically managed by the timer to minimize the error. The user must define only the value of the timer positive increment register (`GPT_TPIR[31:0]` POSITIVE_INC_VALUE bit field) and the timer negative increment register (`GPT_TNIR[31:0]` NEGATIVE_INC_VALUE bit field). An automatic adaptation mechanism is used to simplify the programming model.

Figure 22-10. Block Diagram of the 1-ms Tick Module

timers-009

The **GPT_TPIR**, **GPT_TNIR**, and **GPT_TCVR** registers and adders Add1, Add2, and Add3 are used to define whether the next value loaded in the timer counter register (**GPT_TCRR**[31:0] **TIMER_COUNTER** bit field) is the value of the **GPT_TLDR**[31:0] **LOAD_VALUE** bit field (period less than 1 ms) or the value of **GPT_TLDR**[31:0] **LOAD_VALUE** - 1 (period greater than 1 ms).

Table 22-8 lists the value loaded in the **GPT_TCRR** register according to the sign of the result of Add1, Add2, and Add3.

MSB = 0: Positive value, MSB = 1: Negative value

Table 22-8. Value Loaded in **GPT_TCRR** to Generate 1-ms Tick

| Add1 MSB | Add2 MSB | Add3 MSB | Value of GPT_TCRR Register |
|----------|----------|----------|----------------------------------------------------|
| 0 | 0 | 0 | GPT_TLDR [31:0] LOAD_VALUE bit field |
| 0 | 0 | 1 | GPT_TLDR [31:0] LOAD_VALUE bit field |
| 0 | 1 | 0 | GPT_TLDR [31:0] LOAD_VALUE bit field |
| 0 | 1 | 1 | GPT_TLDR [31:0] LOAD_VALUE - 1 |
| 1 | 0 | 0 | N/A |
| 1 | 0 | 1 | N/A |
| 1 | 1 | 0 | GPT_TLDR [31:0] LOAD_VALUE - 1 |
| 1 | 1 | 1 | GPT_TLDR [31:0] LOAD_VALUE - 1 |

The values of the [GPT_TPIR](#) and [GPT_TNIR](#) registers are calculated using the following formula:

- Positive increment value = $(\text{INTEGER}[F_{\text{clk}} * T_{\text{tick}}] + 1) * 1\text{e}6) - (F_{\text{clk}} * T_{\text{tick}} * 1\text{e}6)$
- Negative increment value = $(\text{INTEGER}[F_{\text{clk}} * T_{\text{tick}}] * 1\text{e}6) - (F_{\text{clk}} * T_{\text{tick}} * 1\text{e}6)$

NOTE: Fclk clock frequency (kHz)

Ttick tick period (ms)

The timer overflow counter register ([GPT_TOCR](#)) and the timer overflow wrapping register [GPT_TOWR](#) are used to filter interrupts. When the timer overflows, it increments the 24-bit [GPT_TOCR](#) register. When the 24-bit [GPT_TOCR](#) register values match the value in the 24-bit [GPT_TOWR](#) register and the timer overflow is asserted, the [GPT_TOCR](#) register is reset and an interrupt is generated to the [GPT_TISR](#) register.

With the conversion block in reset state (the positive increment register, negative increment register, and counter value register are zeroed), the programming model and the behavior of GPTIMER1, GPTIMER2, and GPTIMER10 remain unchanged.

For 1-ms tick with a 32,768-Hz clock:

- [GPT_TPIR](#)[31:0] POSITIVE_INC_VALUE = 232000
- [GPT_TNIR](#)[31:0] NEGATIVE_INC_VALUE = -768000
- [GPT_TLDR](#)[31:0] LOAD_VALUE = 0xFFFF FFE0

NOTE: Any value of the tick period can be generated with the appropriate value of the [GPT_TPIR](#), [GPT_TNIR](#), and [GPT_TLDR](#) registers.

By default, the [GPT_TPIR](#), [GPT_TNIR](#), [GPT_TCVR](#), [GPT_TOCR](#), and [GPT_TOWR](#) registers and the associated logic are in reset mode (all 0s) and have no action on the programming model.

22.2.4.7 Capture Mode Functionality

When a transition is detected on the module input pin (EVENT_CAPTURE), the timer value in the [GPT_TCRR](#) register can be captured and saved in the [GPT_TCAR1](#) or [TCAR2](#) register function of the mode selected in the [GPT_TCLR](#)[13] CAPT_MODE bit. The edge detection circuitry monitors transitions on the input pin (EVENT_CAPTURE).

The rising edge, falling edge, or both, can be selected in the [GPT_TCLR](#)[9:8] TCM bit field to trigger the timer counter capture. The module sets the [GPT_TISR](#)[2] TCAR_IT_FLAG bit for GPTIMER1, GPTIMER2, or GPTIMER10, and the [GPT_IRQSTATUS](#)[2] TCAR_IT_FLAG bit for other timers, when an active edge is detected, and at the same time, the counter value [GPT_TCRR](#) is stored in timer capture register [GPT_TCAR1](#) or [GPT_TCAR2](#), as follows:

- If the [GPT_TCLR](#)[13] CAPT_MODE bit is 0, on the first enabled capture event, the value of the counter register is saved in the [GPT_TCAR1](#) register, and all the next events are ignored (no update on the [GPT_TCAR1](#) register and no interrupt triggering) until the detection logic is reset or the [GPT_TISR](#)[2] TCAR_IT_FLAG bit (or [GPT_IRQSTATUS](#)[2] TCAR_IT_FLAG, depending on the timer) is cleared by writing 1 to it.
- If the [GPT_TCLR](#)[13] CAPT_MODE bit is 1, on the first enabled capture event, the value of the counter register is saved in the [GPT_TCAR1](#) register, and on the second enabled capture event, the value of the counter register is saved in the [GPT_TCAR2](#) register. If a capture interrupt is enabled, the interrupt triggers on the second event capture. All other events are ignored (no update on [GPT_TCAR1](#)/[GPT_TCAR2](#) and no interrupt triggering) until the detection logic is reset or [GPT_TISR](#)[2] TCAR_IT_FLAG bit (or [GPT_IRQSTATUS](#)[2] TCAR_IT_FLAG, depending on the timer) is cleared by writing 1 to it. This mechanism is useful for period calculation of a clock, if that clock is connected to the EVENT_CAPTURE input pin.

The edge detection logic is reset (a new capture is enabled) when the active capture interrupt is served. The `GPT_TISR[2]` `TCAR_IT_FLAG` bit or the `GPT_IRQSTATUS[2]` `TCAR_IT_FLAG` (previously 1) is cleared by writing 1 to it or when the edge detection mode bits (the `GPT_TCLR[9:8]` `TCM` bit field) are changed from no-capture mode detection to any other mode. The timer functional clock (input to prescaler) is used to sample the input pin (`EVENT_CAPTURE`). A negative or positive pulse input can be detected when the pulse time is greater than the functional clock period. An interrupt is issued on edge detection if the capture interrupt-enable bit is set in the `GPT_TIER[2]` `TCAR_IT_ENA` bit (for `GPTIMER1`, `GPTIMER2`, or `GPTIMER10`), or in the `GPT_IRQENABLE_SET[2]` `TCAR_EN_FLAG` bit (for other timers). See the examples in [Figure 22-11](#) and [Figure 22-12](#).

In [Figure 22-11](#), the `GPT_TCLR[9:8]` `TCM` bit field value is `0b01`, and `GPT_TCLR[13]` `CAPT_MODE` bit is 0. Only the rising edge of `EVENT_CAPTURE` triggers a capture in the `GPT_TCAR1` and `GPT_TCAR2` registers, and only the `GPT_TCAR1` register updates.

Figure 22-11. Capture Wave Example for `GPT_TCLR[13]` `CAPT_MODE` = 0

In [Figure 22-12](#), the value of the `GPT_TCLR[9:8]` `TCM` bit field is `0b01`, and the `GPT_TCLR[13]` `CAPT_MODE` bit is 1. Only the rising edge of `EVENT_CAPTURE` triggers a capture in the `GPT_TCAR1` register on the first enabled event, and the `GPT_TCAR2` register updates on the second enabled event.

Figure 22-12. Capture Wave Example for `GPT_TCLR[13]` `CAPT_MODE` = 1

22.2.4.8 Compare Mode Functionality

When compare enable-register [GPT_TCLR\[6\]](#) CE bit is set to 1, the timer value ([GPT_TCR\[31:0\]](#) TIMER_COUNTER bit field) is continuously compared to the value held in the timer match register ([GPT_TMAR](#)). The [GPT_TMAR\[31:0\]](#) COMPARE_VALUE bit field value can be loaded at any time (timer counting or stopped). When the [GPT_TCR](#) and the [GPT_TMAR](#) values match, an interrupt is issued, if the [GPT_TIER\[0\]](#) MAT_IT_ENA (for GPTIMER1, GPTIMER2, and GPTIMER10), or [GPT_IRQSTATUS_SET\[0\]](#) MAT_EN_FLAG bit (for other timers) is set.

The right programming way is to write a compare value to the [GPT_TMAR](#) register before setting the [GPT_TCLR\[6\]](#) CE bit to prevent any unwanted interrupts due to a reset value matching effect.

The dedicated output pin (timer PWM) can be programmed in the [GPT_TCLR\[12\]](#) PT bit through the [GPT_TCLR\[11:10\]](#) TRG bit field to generate one positive pulse (timer clock duration) or to invert the current value (toggle mode) when an overflow or a match occurs.

22.2.4.9 Prescaler Functionality

A prescaler can be used to divide the timer counter input clock frequency. The prescaler is enabled when the [GPT_TCLR\[5\]](#) PRE bit is set. The [GPT_TCLR\[4:2\]](#) PTV bit field sets the second prescaler ratio. The prescaler counter is reset when the timer counter is stopped or reloaded on-the-fly.

[Table 22-9](#) lists the prescaler/timer reload values versus contexts.

Table 22-9. Prescaler/Timer Reload Values Versus Contexts

| Context | Prescaler | Timer Counter |
|----------------------------------|-----------|--------------------------------|
| Overflow (when autoreload is on) | Reset | GPT_TLDR[31:0] |
| GPT_TCR write | Reset | GPT_TCR[31:0] |
| GPT_TTGR write | Reset | GPT_TLDR[31:0] |
| Stop | Reset | Frozen |

22.2.4.10 Pulse-Width Modulation

The timer can be configured to provide a programmable PWM output. The timer PWM output pin can be configured to toggle on an event. The [GPT_TCLR\[11:10\]](#) TRG bit field determines on which register value the PWM pin toggles. Either overflow alone or both overflow and match can be selected to toggle the timer PWM pin when a compare condition occurs.

CAUTION

In toggle mode, when [GPT_TCLR\[11:10\]](#) TRG = 0x2 (overflow and match), the first event that toggles the PWM line is an overflow event. If a match event occurs first; it does not toggle the PWM line (see [Figure 22-14](#)).

The [GPT_TCLR\[7\]](#) SCPWM bit can be programmed to set or clear the timer PWM output signal only while the counter is stopped or the trigger is off. This allows setting the output pin to a known state before modulation starts. Modulation synchronously stops when the [GPT_TCLR\[11:10\]](#) TRG bit field is cleared and overflow occurs. This allows fixing a deterministic state of the output pin when modulation stops.

In [Figure 22-13](#), the internal overflow pulse is set each time (0xFFFF FFFF - [GPT_TLDR\[31:0\]](#) LOAD_VALUE + 1) the value is reached, and the internal match pulse is set when the counter reaches the [GPT_TMAR](#) register value. Depending on the value of the [GPT_TCLR\[12\]](#) PT bit and [GPT_TCLR\[11:10\]](#) TRG bit field, the timer provides pulse or PWM event on the output pin (timer PWM).

The [GPT_TLDR](#) and [GPT_TMAR](#) registers must keep values below the overflow value (0xFFFF FFFF) by at least two units. In case the PWM trigger events are both overflow and match, the difference between the values kept in the [GPT_TMAR](#) register and the value in the [GPT_TLDR](#) register must be at least two units. When match event is used, the compare mode [GPT_TCLR\[6\]](#) CE bit must be set.

In Figure 22-13, the `GPT_TCLR[7]` SCPWM bit is set to 0. In Figure 22-14, the `GPT_TCLR[7]` SCPWM bit is set to 1. To obtain the desired wave form, start the counter at `0xFFFF FFFE` value (to ensure an overflow first) or adjust the line polarity (`GPT_TCLR[7]` SCPWM bit).

Figure 22-13. Timing Diagram of PWM With `GPT_TCLR[7]` SCPWM Bit = 0

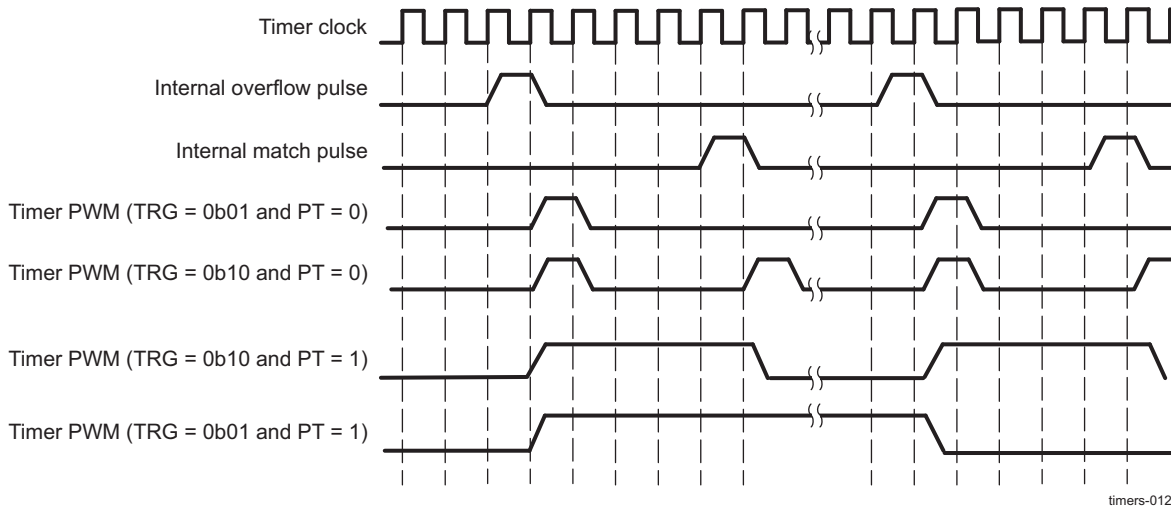

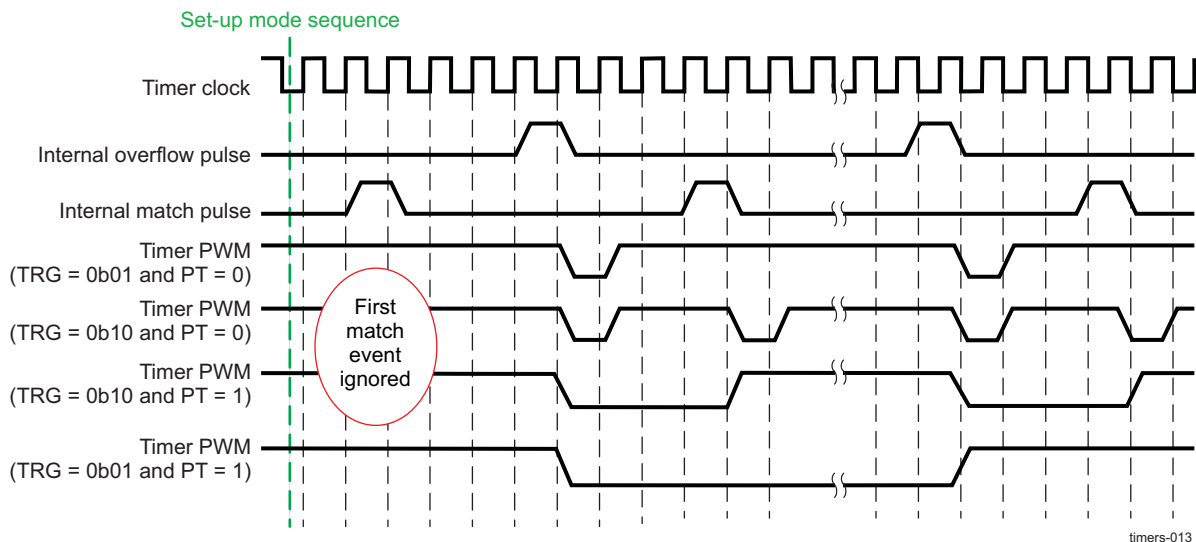

Figure 22-14. Timing Diagram of PWM With `GPT_TCLR[7]` SCPWM Bit = 1

22.2.4.11 Timer Counting Rate

The timer rate is defined by the following values:

- Value of the prescaler fields (the `GPT_TCLR[5]` PRE bit and the `GPT_TCLR[4:2]` PTV bit field)
- Value loaded into the timer-load register (`GPT_TLDR`)

Table 22-10 lists the prescaler clock ratio values.

Table 22-10. Prescaler Clock Ratio Values

| <code>GPT_TCLR[5]</code> PRE | <code>GPT_TCLR[4:2]</code> PTV | Divisor (PS) |
|------------------------------|--------------------------------|--------------|
| 0 | X | 1 |
| 1 | 0 | 2 |
| 1 | 1 | 4 |

Table 22-10. Prescaler Clock Ratio Values (continued)

| GPT_TCLR[5] PRE | GPT_TCLR[4:2] PTV | Divisor (PS) |
|------------------------|--------------------------|---------------------|
| 1 | 2 | 8 |
| 1 | 3 | 16 |
| 1 | 4 | 32 |
| 1 | 5 | 64 |
| 1 | 6 | 128 |
| 1 | 7 | 256 |

Thus, the timer overflow rate is expressed as:

$$\text{OVF_Rate} = (0xFFFF\ FFFF - \text{GPT_TLDR} + 1) * (\text{timer-functional clock period}) * \text{PS}$$

With (timer-functional clock period) = 1/(timer-functional clock frequency) and PS = 2^(PTV + 1) if prescaler is enabled, or PS = 1 if prescaler is disabled.

CAUTION

Internal resynchronization causes any write to the **GPT_TCLR[1]** ST bit to have some latency before the register is updated:

2.5 * functional clock cycles write_GPT_TCLR_latency 3.5 * functional clock cycles

Remember to consider this latency whenever the timer must be started or stopped by a software change to the **GPT_TCLR[1]** ST bit.

CAUTION

- In the non-PWM mode, **GPT_TLDR** must be maintained at less than or equal to 0xFFFF FFFE.
- In the PWM mode, **GPT_TLDR** must be maintained at less than or equal to 0xFFFF FFFD.

For example, with a timer clock input of 32 kHz and the **GPT_TCLR[5]** PRE bit set to 0, the timer output period is as listed in [Table 22-11](#).

Table 22-11. Value and Corresponding Interrupt Period

| GPT_TLDR[31:0] LOAD_VALUE | Interrupt Period |
|----------------------------------|-------------------------|
| 0x0000 0000 | 39 h |
| 0xFFFF 0000 | 2.1 s |
| 0xFFFF FFF0 | 524 μs |
| 0xFFFF FFFE | 65.5 μs |

22.2.4.12 Timer Under Emulation

During emulation mode, the timer continues to run according to the value of the **GPT1MS_TIOCP_CFG[5]/GPT_TIOCP_CFG[1]** EMUFREE bit.

If the **GPT1MS_TIOCP_CFG[5]/GPT_TIOCP_CFG[1]** EMUFREE bit is set to 1, timer execution is not stopped in emulation mode and the interrupt is still generated when overflow or match is reached.

If the **GPT1MS_TIOCP_CFG[5]/GPT_TIOCP_CFG[1]** EMUFREE bit is set to 0, the prescaler and timer are frozen and both resume on exit from emulation mode. The asynchronous external input pin (dmtimer_i_pwm_evt, with i=[8:11]) is internally synchronized on two timer-clock rising edges.

22.2.4.13 Accessing GP Timer Registers

All accesses are nonposted until software reconfiguration. All registers are 32 bits wide, accessible through the L4 interface with 16-bit or 32-bit access (read/write).

Any 16-bit write access must be least-significant bit (LSB) first, and the second write access must be most-significant bit (MSB) first. Write operations to the following GP timer registers can skip the MSB access if it is not necessary to update the 16 MSBs of the register:

- [GPT_TIDR](#)
- [GPT_TIOCP_CFG](#)
- [GPT1MS_TIOCP_CFG](#)
- [GPT_IRQSTATUS_RAW](#)
- [GPT_IRQSTATUS](#)
- [GPT_IRQENABLE_SET](#)
- [GPT_IRQENABLE_CLR](#)
- [GPT_IRQWAKEEN](#)
- [GPT_TISR](#)
- [GPT_TIER](#)
- [GPT_TWER](#)
- [GPT_TSICR](#)

Write operations to the following functional registers must be complete (the MSB must be written even if the MSB data is not used):

- [GPT_TCLR](#)
- [GPT_TCRR](#)
- [GPT_TLDR](#)
- [GPT_TTGR](#)
- [GPT_TMAR](#)
- [GPT_TPIR](#)
- [GPT_TNIR](#)
- [GPT_TCVR](#)
- [GPT_TOCR](#)
- [GPT_TOWR](#)

The following L4 synchronous registers are not affected by the posted/nonposted mode selection; the write/read operation is effective and acknowledged (command accepted) after one L4 clock cycle from command assertion:

- [GPT_TIDR](#)
- [GPT_TIOCP_CFG](#)
- [GPT1MS_TIOCP_CFG](#)
- [GPT_TISTAT](#)
- [GPT_IRQSTATUS](#)
- [GPT_IRQSTATUS_RAW](#)
- [GPT_IRQENABLE_SET](#)
- [GPT_IRQENABLE_CLR](#)
- [GPT_IRQWAKEEN](#)
- [GPT_TWPS](#)
- [GPT_TSICR](#)

22.2.4.13.1 Writing to Timer Registers

The host uses the L4 interface to write to the following registers synchronously with the timer interface clock:

- [GPT_TLDR](#)
- [GPT_TCRR](#)
- [GPT_TCLR](#)
- [GPT_TIOCP_CFG](#)
- [GPT1MS_TIOCP_CFG](#)
- [GPT_IRQSTATUS](#)
- [GPT_IRQENABLE_SET](#)
- [GPT_IRQENABLE_CLR](#)
- [GPT_IRQWAKEEN](#)
- [GPT_TTGR](#)
- [GPT_TSICR](#)
- [GPT_TMAR](#)

GPTIMER1, GPTIMER2, and GPTIMER10 also have the following registers:

- [GPT_TPIR](#)
- [GPT_TNIR](#)
- [GPT_TCVR](#)
- [GPT_TOCR](#)
- [GPT_TOWR](#)
- [GPT_TIER](#)
- [GPT_TISR](#)
- [GPT_TWER](#)

In 16-bit access mode, the 16 LSBs must be written before writing to the 16 MSBs.

22.2.4.13.1.1 Write Posting Synchronization Mode

This mode is used if the [GPT_TSICR\[2\] POSTED](#) bit is set to 1.

This mode uses a posted write scheme to update any internal register ([GPT_TCLR](#), [GPT_TCRR](#), [GPT_TLDR](#), [GPT_TTGR](#), [GPT_TMAR](#), and [GPT_TPIR](#), [GPT_TNIR](#), [GPT_TCVR](#), [GPT_TOCR](#), and [GPT_TOWR](#) for GPTIMER1, GPTIMER2, and GPTIMER10). Therefore, the write transaction is immediately acknowledged on the L4 interface, although the effective write operation occurs later due to a resynchronization in the timer clock domain. The advantage is that neither the interconnect nor the device that requested the write transaction are stalled.

For each register, a status bit is provided in the timer write-posted status register [GPT_TWPS](#). In this mode, it is mandatory that the software checks this status bit prior to any write access. In case a write is attempted to a register with a previous access pending, the previous access is discarded without notice.

The timer module updates the timer counter register value synchronously with the L4 clock. Consequently, any read access to the timer counter register [GPT_TCRR](#) does not add any resynchronization latency; the current value is always available.

NOTE: Since the overflow IRQ is generated, when the TCRR value reaches 0xFFFF FFFF, and not when it changes its value to the value after overflow, one must wait a delay of (1 * PS * timer-functional clock period) before any read access to the timer counter register [GPT_TCRR](#) to ensure a correct reading of its content.

If a write access is pending for a register, reading from this register does not yield a correct result. Software synchronization must be used to avoid incorrect results.

The drawback of this automatic update mechanism is that it assumes a given relationship between the timer interface frequency and the timer clock frequency.

Functional frequency range: $\text{freq}(\text{timer clock}) < \text{freq}(\text{L4 interface clock})/4$.

22.2.4.13.1.2 Write Nonposting Synchronization Mode

This mode is used if the `GPT_TSICR[2]` POSTED bit is set to 0. It uses a nonposted write scheme to update any internal register. Therefore, the write transaction is not acknowledged on the L4 interface until the effective write operation occurs after the resynchronization in the timer functional clock domain. The drawback is that both the interconnect and the device that requested the write transaction are stalled during this period.

The same full resynchronization scheme is used for a read transaction, and the same stall period applies. A register read following a write to the same register is always coherent.

This mode is functional regardless of the ratio between the L4 interface frequency and the timer clock frequency.

22.2.4.13.2 Reading From Timer Counter Registers

In 16-bit access mode, reading the 16 LSBs from the timer counter registers (`GPT_TCRR`, `GPT_TCAR1`, and `GPT_TCAR2`) captures the current timer counter value. This must be followed by reading the 16 MSBs.

IVA3 subsystem 16-bit accesses can be interleaved with MPU subsystem 32-bit accesses.

NOTE: LSB/MSB accesses cannot be interleaved (that is, the sequence LSB register 1, LSB register 2, MSB register 1, MSB register 2 is not supported).

22.2.5 GP Timer Low-Level Programming Models

This section covers the low-level hardware programming sequences for configuration and usage of the module.

22.2.5.1 Global Initialization

22.2.5.1.1 Global Initialization of Surrounding Modules

This section identifies the requirements for initializing the surrounding modules when the GP timer module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the GP timer. For more information, see [Section 22.2.3 GP Timers Integration](#) and [Section 22.2.2, GP Timers Environment](#).

Table 22-12. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRCM | The module interface and functional clocks must be enabled. For more information about the module configuration, see Section 3.1.1.1.2, Module Level Clock Management , in Chapter 3, Power, Reset, and Clock Management . |
| Control Module | The module specific pad muxing must be set in the control module. For more information about the module configuration, see Section 18.4.8 PAD Functional Multiplexing and Configuration , in Chapter 18, Control Module . |
| MPU INTC | The MPU INTC configuration must be done to enable the interrupts from the GP timer module. See Section 4.4.3, Interrupt Controller Registers , in Chapter 4, Cortex-A9 MPU Subsystem . |
| DSP INTC | The DSP INTC configuration must be done to enable the interrupts from GP timer module. See Section 5.3.2.6, INTC , in Chapter 5, DSP Subsystem . |

22.2.5.1.2 GP Timer Module Global Initialization

22.2.5.1.2.1 Main Sequence – GP Timer Module Global Initialization

This section identifies the main steps for initializing the GP timer module when the module is to be used for the first time.

Table 22-13. GP Timer Module Global Initialization

| Step | Register/Bit Field/Programming Model | Value |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------|-------|
| Execute software reset. | GPT_TIOCP_CFG[0] SOFTRESET ⁽¹⁾ or GPT1MS_TIOCP_CFG[0] SOFTRESET ⁽²⁾ | 0x1 |
| Wait until reset release? | GPT_TIOCP_CFG[0] SOFTRESET ⁽¹⁾ or GPT1MS_TIOCP_CFG[0] SOFTRESET ⁽²⁾ | 0x0 |
| Configure Idle mode. | GPT_TIOCP_CFG[3:2] IDLEMODE ⁽¹⁾ or GPT1MS_TIOCP_CFG[4:3] IDLEMODE ⁽²⁾ | xx |
| Configure clock activity. | GPT1MS_TIOCP_CFG[9:8] CLOCKACTIVITY ⁽²⁾ | xx |
| Configure wake-up feature. | GPT1MS_TIOCP_CFG[2] ENAWAKEUP ⁽²⁾ | x |
| Enable wake-up interrupt events. | GPT_IRQWAKEEN[2:0] ⁽¹⁾ or GPT_TWERR[2:0] ⁽²⁾ | x |
| Select posted mode. | GPT_TSICR[2] POSTED | x |

⁽¹⁾ Applies only to GPTIMER3 through GPTIMER9, and GPTIMER11

⁽²⁾ Applies only to GPTIMER1, GPTIMER2, and GPTIMER10

22.2.5.2 Operational Mode Configuration

22.2.5.2.1 GP Timer Mode

22.2.5.2.1.1 Main Sequence – GP Timer Mode Configuration

Table 22-14. GP Timer Mode Configuration

| Step | Register/Bit Field/Programming Model | Value |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------|-------|
| Select autoreload mode | GPT_TCLR[1] AR | x |
| Set prescale timer value. | GPT_TCLR[4:2] PTV | xxx |
| Enable prescaler. | GPT_TCLR[5] PRE | 0x1 |
| Enable overflow interrupt. | GPT_TIER[1] OVF_IT_ENA ⁽¹⁾ or GPT_IRQENABLE_SET[1] OVF_EN_FLAG ⁽²⁾ | 0x1 |
| Load timer counter value. | GPT_TCRR | xxx |
| Load timer load value. | GPT_TLDR | xxx |
| Start the timer. | GPT_TCLR[0] ST | 0x1 |

⁽¹⁾ Applies only to GPTIMER1, GPTIMER2, and GPTIMER10.

⁽²⁾ Applies only to GPTIMER3 through GPTIMER 9, and GPTIMER11.

22.2.5.2.2 GP Timer Compare Mode

22.2.5.2.2.1 Main Sequence – GP Timer Compare Mode Configuration

Table 22-15. GP Timer Compare Mode Configuration

| Step | Register/Bit Field/Programming Model | Value |
|---------------------------|--------------------------------------|-------|
| Select autoreload mode. | GPT_TCLR[1] AR | x |
| Set prescale timer value. | GPT_TCLR[4:2] PTV | xxx |
| Enable prescaler. | GPT_TCLR[5] PRE | 0x1 |

Table 22-15. GP Timer Compare Mode Configuration (continued)

| Step | Register/Bit Field/Programming Model | Value |
|---------------------------|------------------------------------------------------------------------------------------------------------------------|-------|
| Enable match interrupt. | GPT_TIER[0] MAT_IT_ENA⁽¹⁾ or GPT_IRQENABLE_SET[0] MAT_EN_FLAG⁽²⁾ | 0x1 |
| Load timer counter value. | GPT_TCRR | xxx |
| Load timer compare value. | GPT_TMAR | xxx |
| Enable Compare mode. | GPT_TCLR[6] CE | 0x1 |
| Start the timer. | GPT_TCLR[0] ST | 0x1 |

⁽¹⁾ Applies only to GPTIMER1, GPTIMER2, and GPTIMER10.

⁽²⁾ Applies only to GPTIMER3 through GPTIMER9, and GPTIMER11.

22.2.5.2.3 GP Timer Capture Mode

22.2.5.2.3.1 Main Sequence – GP Timer Capture Mode Configuration

Table 22-16. GP Timer Capture Mode Configuration

| Step | Register/Bit Field/Programming Model | Value |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------|-------|
| Initialize capture mode. | See Section 22.2.5.2.3.2 . | |
| Enable capture interrupt. | GPT_TIER[2] TCAR_IT_ENA⁽¹⁾ or GPT_IRQENABLE_SET[2] TCAR_EN_FLAG⁽²⁾ | 0x1 |
| Start the timer. | GPT_TCLR[0] ST | 0x1 |
| Detect event. | See Section 22.2.5.2.3.3 . | |

⁽¹⁾ Applies only to GPTIMER1, GPTIMER2, and GPTIMER10.

⁽²⁾ Applies only to GPTIMER3 through GPTIMER9, and GPTIMER11.

22.2.5.2.3.2 Subsequence – Initialize Capture Mode

Table 22-17. Initialize Capture Mode

| Step | Register/Bit Field/Programming Model | Value |
|--------------------------------------------------------------------------------------|----------------------------------------------------|-------|
| Select autoreload mode. | GPT_TCLR[1] AR | x |
| Set prescale timer value. | GPT_TCLR[4:2] PTV | xxx |
| Enable prescaler. | GPT_TCLR[5] PRE | 0x1 |
| Select GPTx (where x = 8 to 11). Capture input at device pin dmtimerx_pwm_evt. | GPT_TCLR[14] GPO_CFG⁽¹⁾ | 0x1 |
| Select single or second event capture. | GPT_TCLR[13] CAPT_MODE | x |
| Select transition capture mode. | GPT_TCLR[9:8] TCM | xx |

⁽¹⁾ Applies only to GPTIMER8 through GPTIMER11

22.2.5.2.3.3 Subsequence – Detect Event

Table 22-18. Detect Event

| Step | Register/Bit Field/Programming Model | Value |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------|-------|
| Wait until event detected? | GPT_TISR[2] TCAR_IT_FLAG⁽¹⁾ or GPT_IRQSTATUS[2] TCAR_IT_FLAG⁽²⁾ | = 0x1 |
| Read Timer capture value. | GPT_TCAR1 and/or GPT_TCAR2 | |

⁽¹⁾ Applies only to GPTIMER1, GPTIMER2, and GPTIMER10.

⁽²⁾ Applies only to GPTIMER3 through GPTIMER9, and GPTIMER11.

Table 22-18. Detect Event (continued)

| Step | Register/Bit Field/Programming Model | Value |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------|-------|
| Clear capture interrupt request. | GPT_TISR [2] TCAR_IT_FLAG ⁽¹⁾ or GPT_IRQSTATUS [2] TCAR_IT_FLAG ⁽²⁾ | 0x1 |

22.2.5.2.4 GP Timer PWM Mode

22.2.5.2.4.1 Main Sequence – GP Timer PWM Mode Configuration

Table 22-19. GP Timer PWM Mode Configuration

| Step | Register/Bit Field/Programming Model | Value |
|----------------------------------------------------------------------------|------------------------------------------------------|-------|
| Select autoreload mode. | GPT_TCLR [1] AR | x |
| Set prescale timer value. | GPT_TCLR [4:2] PTV | xxx |
| Enable prescaler. | GPT_TCLR [5] PRE | 0x1 |
| Select trigger output mode. | GPT_TCLR [11:10]TRG | xx |
| Select pulse or toggle modulation PWM mode. | GPT_TCLR [12] PT | x |
| Select GPTx (where x = 8 to 11) pwm output at device pin dmtimerx_pwm_evt. | GPT_TCLR [14] GPO_CFG ⁽¹⁾ | 0x0 |
| Configure PWM output pin default value. | GPT_TCLR [7] SCPWM | x |
| Load timer load value. | GPT_TLDR | xxx |
| Load timer compare value. | GPT_TMAR | xxx |
| Enable compare. | GPT_TCLR [6] CE | 0x1 |
| Start the timer. | GPT_TCLR [0] ST | 0x1 |

⁽¹⁾ Applies only to GPTIMER8 through GPTIMER11

22.2.6 GP Timer Register Manual

22.2.6.1 GP Timer Instance Summary

[Table 22-20](#) lists the base address and block size for the GP timer module instances.

Table 22-20. GP Timer Instance Summary

| Module Name | Base Address L4 Interconnect | Base Address L3 Interconnect | Base Address Cortex-A9 Private Access | Base Address DSP Private Access | Size |
|-------------|---------------------------------|---------------------------------|---------------------------------------------|---------------------------------------|------|
| GPTIMER2 | 0x4803 2000 | - | - | - | 4 KB |
| GPTIMER3 | 0x4803 4000 | - | - | - | 4 KB |
| GPTIMER4 | 0x4803 6000 | - | - | - | 4 KB |
| GPTIMER9 | 0x4803 E000 | - | - | - | 4 KB |
| GPTIMER10 | 0x4808 6000 | - | - | - | 4 KB |
| GPTIMER11 | 0x4808 8000 | - | - | - | 4 KB |
| GPTIMER5 | - | 0x4903 8000 | 0x4013 8000 | 0x01D3 8000 | 4 KB |
| GPTIMER6 | - | 0x4903 A000 | 0x4013 A000 | 0x01D3 A000 | 4 KB |
| GPTIMER7 | - | 0x4903 C000 | 0x4013 C000 | 0x01D3 C000 | 4 KB |
| GPTIMER8 | - | 0x4903 E000 | 0x4013 E000 | 0x01D3 E000 | 4 KB |
| GPTIMER1 | 0x4A31 8000 | - | - | - | 4 KB |

NOTE: Private Access is an access which is not using the L3/L4 interconnects.

22.2.6.2 GP Timer Registers

22.2.6.2.1 GP Timer Register Summary

CAUTION

The GP timer registers are limited to 32-bit and 16-bit data accesses; 8-bit access is not allowed and can corrupt the register content.

[Table 22-21](#) through [Table 22-27](#) provide the register summary and associated offset addresses for the 11 GP timer internal registers.

Table 22-21. GPTIMER1, GPTIMER2, and GPTIMER10 Register Mapping Summary

| Register Name | Type | Register Width (Bits) | Address Offset | GPTIMER1 Physical Address L4 Interconnect | GPTIMER2 Physical Address L4 Interconnect | GPTIMER10 Physical Address L4 Interconnect |
|------------------|------|-----------------------|----------------|-------------------------------------------|-------------------------------------------|--------------------------------------------|

|------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------------|
| 31:4 | RESERVED | Reserved | R | 0x00000000 |
| 3:2 | IDLEMODE | Power management, req/ack control 0x0: Force-idle mode: local target idle state follows (acknowledges) the system idle requests unconditionally, that is, regardless of the IP module internal requirements. Back-up mode, for debug only. 0x1: No-idle mode: local target never enters idle state. Back-up mode, for debug only. 0x2: Smart-idle mode: local target idle state eventually follows (acknowledges) the system idle requests, depending on the IP module internal requirements. IP module should not generate (IRQ- or DMA-request-related) wake-up events. 0x3: Smart-idle wake-up-capable mode: local target idle state eventually follows (acknowledges) the system idle requests, depending on the IP module internal requirements. IP module may generate (IRQ- or DMA-request-related) wake-up events when in idle state. Mode is only relevant if the appropriate IP module <i>swake-up</i> output(s) is (are) implemented. | RW | 0x0 |
| 1 | EMUFREE | Emulation mode 0x0: The timer is frozen in emulation mode (PINSUSPENDN signal active). 0x1: The timer runs free, regardless of PINSUSPENDN value. | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-------|
| 0 | SOFTRESET | Software reset 0x0: Read 0: reset done, no pending action Write 0: No action 0x1: Read 1: initiate software reset Write 1: Reset ongoing | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|-------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|---------|
| 31:15 | RESERVED | Reserved | R | 0x00000 |
| 14 | GPO_CFG | General-purpose output - this register directly drives the GPTi_PORGPOCFG output pin. For specific use of the GPO_CFG bit, see Section 22.2.2.1 , <i>GP Timer External System Interface</i> . 0x0: GPTi_PORGPOCFG drives 0. 0x1: GPTi_PORGPOCFG drives 1. | RW | 0 |
| 13 | CAPT_MODE | Capture mode select bit (first/second) 0x0: Single capture: Capture the first enabled capture event in TCAR1. 0x1: Capture on second event: Capture the second enabled capture event in TCAR2. | RW | 0 |
| 12 | PT | Pulse or toggle mode on GPTi_PWM_out output pin 0x0: Pulse modulation 0x1: Toggle modulation | RW | 0 |
| 11:10 | TRG | Trigger output mode on GPTi_PWM_out output pin 0x0: No trigger 0x1: Trigger on overflow. 0x2: Trigger on overflow and match. 0x3: Reserved | RW | 0x0 |
| 9:8 | TCM | Transition capture mode on GPTi_EVENT_CAPTURE input pin (When the TCM field passed from (00) to any other combination, the TCAR_IT_FLAG and the edge detection logic are cleared.) 0x0: No capture 0x1: Capture on rising edges of GPTi_EVENT_CAPTURE pin 0x2: Capture on falling edges of GPTi_EVENT_CAPTURE pin 0x3: Capture on both edges of GPTi_EVENT_CAPTURE pin | RW | 0x0 |
| 7 | SCPWM | Pulse width modulation output pin default setting This bit must be set or clear while the timer is stopped or the trigger is off. 0x0: Clear the GPTi_PWM_out output pin and select positive pulse for pulse mode. 0x1: Set the GPTi_PWM_out output pin and select negative pulse for pulse mode. | RW | 0 |
| 6 | CE | Compare enable 0x0: Compare mode is disable. 0x1: Compare mode is enable. | RW | 0 |
| 5 | PRE | Prescaler enable 0x0: The TIMER clock input pin clocks the counter. 0x1: The divided input pin clocks the counter. | RW | 0 |
| 4:2 | PTV | Prescale clock timer value The timer counter is prescaled with the value $2^{(PTV+1)}$. Example: PTV = 3, counter increases value (if started) after 16 functional clock periods. | RW | 0x0 |
| 1 | AR | Autoreload mode 0x0: One shot timer 0x1: Autoreload timer | RW | 0 |

| Bits | Field Name | Description | Type | Reset |
|------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-------|
| 0 | ST | Start/stop timer control 0x0: Stop timer: Only the counter is frozen. If one-shot mode selected (AR =0), this bit is automatically reset by internal logic when the counter is overflowed. 0x1: Start timer | RW | 0 |

22.3 Watchdog Timers

22.3.1 Watchdog Timers Overview

The device includes two instances of the 32-bit watchdog timer: WDT2 and WDT3. Figure 22-15 shows how each timer is connected in the device.

NOTE: WDT_i (where *i* is the watchdog timer instance: *i* = 2 or 3) stands for the following:

- WDT2: Watchdog timer 2, also called MPU watchdog timer
- WDT3: Watchdog timer 3, also called IVA3 watchdog timer

Each watchdog timer is an upward counter capable of generating a pulse on the reset pin and an interrupt to the device system modules following an overflow condition. The MPU watchdog timer serves a reset to the PRCM module and an interrupt to the MPU. The IVA3 watchdog timer serves a watchdog interrupt to the MPU, and its reset outputs are unused.

The watchdog timers can be accessed, loaded, and cleared by registers through the L4 interface. The MPU and IVA3 watchdog timers have the 32-kHz clock for their timer clock input.

The MPU watchdog timer directly generates a warm reset condition on overflow. The IVA3 watchdog timer generates an MPU interrupt condition on overflow, which can be used by the application software through the PRCM module to indirectly trigger a reset condition (that is, to the IVA3 subsystem).

The MPU watchdog timer connects to a single target agent port on the L4 interconnect.

Figure 22-15. Watchdog Timers Block Diagram

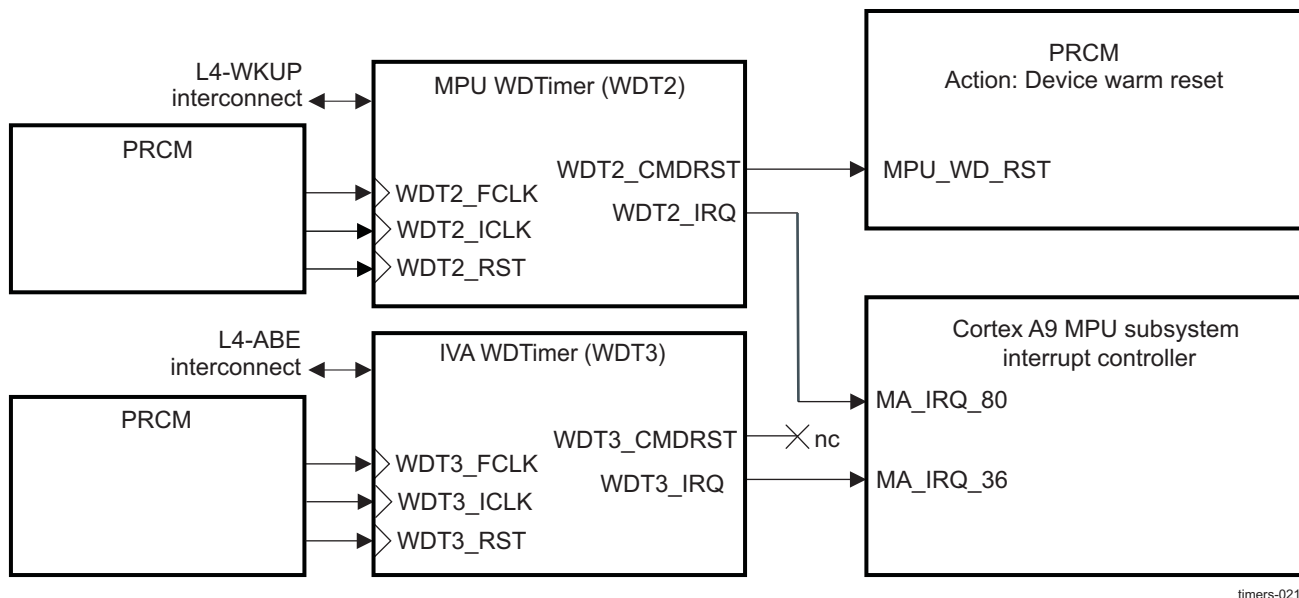

Table 22-80 lists the default state of the watchdog timers in the device.

Table 22-80. Watchdog Timers Default State

| Timer | Default State | |
|-----------|---------------|-------------|
| MPU WDT2 | Enabled | Not running |
| IVA3 WDT3 | Enabled | Not running |

NOTE: The default state of the watchdog timers described in [Table 22-80](#) is considered to be their state immediately after ROM code execution. For more information, see [Chapter 27, Initialization](#).

22.3.1.1 Watchdog Timers Features

The main features of the watchdog timer controllers are:

- L4 slave interface support:
 - 32-bit data bus width
 - 32-/16-bit access supported
 - 8-bit access not supported
 - 11-bit address bus width
 - Burst mode not supported
 - Only posted write/read internal resynchronization mode supported
- Free-running 32-bit upward counter
- Programmable divider clock source (2^n where $n = [0:7]$)
- On-the-fly read/write register (while counting)
- Subset programming model of the GP timer
- The watchdog timers are reset either on power-on or after a warm reset before they start counting.
- Reset or interrupt actions when a timer overflow condition occurs
- The watchdog timer generates a reset or an interrupt in its hardware integration (WDT2 or WDT3).

22.3.2 Watchdog Timer Environment

The watchdog timers are accessible through the L4 interface.

22.3.3 Watchdog Timer Integration

Figure 22-16 shows the integration of the watchdog timers in the device.

Figure 22-16. Watchdog Timers Integration

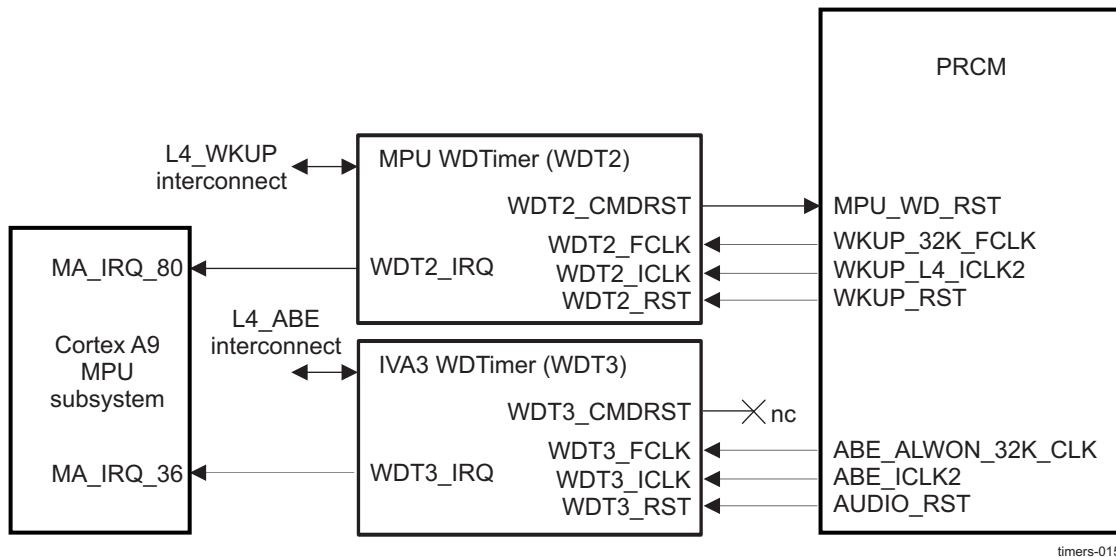

Table 22-81 through Table 22-83 summarize the integration of the module in the device.

Table 22-81. Integration Attributes

| Module Instance | Attributes | | |
|-----------------|--------------|--------------------|--------------|
| | Power Domain | Wake-Up Capability | Interconnect |
| WDT2 | PD_WKUP | Yes | L4_WKUP |
| WDT3 | PD_AUDIO | Yes | L4_ABE |

Table 22-82. Clocks and Resets

| Clocks | | | | |
|-----------------|-------------------------|--------------------|--------|-----------------------|
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| WDT2 | WDT2_FCLK | WKUP_32K_FCLK | PRCM | WDT2 functional clock |
| WDT2 | WDT2_ICLK | WKUP_L4_ICLK2 | PRCM | WDT2 interface clock |
| WDT3 | WDT3_FCLK | ABE_ALWON_32K_CLK | PRCM | WDT3 functional clock |
| WDT3 | WDT3_ICLK | ABE_ICLK2 | PRCM | WDT3 interface clock |
| Resets | | | | |
| Module Instance | Destination Signal Name | Source Signal Name | Source | Description |
| WDT2 | WDT2_RST | WKUP_RST | PRM | Reset to WDT2 |
| WDT2 | MPU_WD_RST | WDT2_CMDRST | WDT2 | Reset to PRCM |
| WDT3 | WDT3_RST | AUDIO_RST | PRM | Reset to WDT3 |

NOTE: WDT2 is reset on power on or after a warm reset before it starts counting.

WDT3 is reset on power on or after a warm reset, and then it does not start counting.

Table 22-83. Hardware Requests

| Interrupt Requests | | | | |
|--------------------|--------------------|-------------------------|---------------|---------------------------------|
| Module Instance | Source Signal Name | Destination Signal Name | Destination | Description |
| WDT2 | WDT2_IRQ | MA_IRQ_80 | Cortex-A9 MPU | WDT2 interrupt to Cortex-A9 MPU |
| WDT3 | WDT3_IRQ | MA_IRQ_36 | Cortex-A9 MPU | IVA3 watchdog overflow |
| No DMA Requests | | | | |

NOTE:

- See [Section 22.3.4.2, Interrupts](#), for interrupt source description.

22.3.4 Watchdog Timers Functional Description

22.3.4.1 Power Management

There are two clock domains in the watchdog timers:

- Functional clock domain: WDTi_FCLK is the watchdog timer functional clock. It is used to clock the watchdog timer internal logic.
- Interface clock domain: WDTi_ICLK is the watchdog timer interface clock. It is used to synchronize the watchdog timer L4 port to the L4 interconnect. All accesses from the interconnect are synchronous to WDTi_ICLK.

Table 22-82 lists the source clocks for each watchdog timer in the device. For more information about clock control and domains, see Section 3.1.1.1, *Clock Management* in Chapter 3, *Power, Reset, and Clock Management*.

From a global system power-management perspective, when one or both of the watchdog timer clocks is no longer required, the watchdog timers can be deactivated at the PRCM module level in the corresponding registers.

At the PRCM module level, when the conditions to shut off the PRCM module functional or interface output clocks are met (for more information, see the Section 3.1.1.1.4, *Clock Domain Level Clock Management*), the PRCM module automatically launches a hardware handshake protocol to ensure the watchdog timer is ready to have its clocks switched off. Namely, the PRCM module asserts an IDLE request to the watchdog timer.

Although this handshake is a hardware function and out of software control, the way the watchdog timer acknowledges the PRCM IDLE request is configurable through the WDT_WDSC[4:3] IDLEMODE bit field. Table 22-84 lists the settings and related acknowledgment modes of the IDLEMODE bit field.

Table 22-84. IDLEMODE Settings

| IDLEMODE Value | Selected Mode | Description |
|----------------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 00 | Force-idle | The watchdog timer unconditionally acknowledges the IDLE request from the PRCM module, regardless of its internal operations. This mode must be used carefully, because it does not prevent loss of data when the clock is switched off. |
| 01 | No-idle | The watchdog timer never acknowledges an IDLE request from the PRCM module. This mode is safe from a module point of view, because it ensures that the clocks remain active. It is not efficient from a power-saving perspective, however, because it does not allow the PRCM module output clock to be shut off and thus the power domain to be set to a lower power state. |
| 10 | Smart-idle | The watchdog timer acknowledges the IDLE request, basing its decision on its internal activity. The acknowledge signal is asserted only when all pending transactions and IRQ requests are treated. This is the best approach for efficient system power management. |
| 11 | Smart-idle wakeup-capable mode | The watchdog timer acknowledges the IDLE request, basing its decision on its internal activity. The timer generates (IRQ-request-related) wake-up events when in IDLE state if the WDT_WIRQWAKEEN[1:0] bits are set to 1. |

22.3.4.1.1 Wake-Up Capability

If the WDT_WDSC[4:3] IDLEMODE bit field sets smart-idle wakeup-capable mode ($= 0 \times 3$), the timer evaluates its internal capability to have the interface clock switched off. When there is no more internal activity (no pending interrupt sources: match, overflow, or timer capture events), the idle acknowledge signal is asserted and the timer enters into sleep mode, ready to issue a wake-up request. This wake-up request is sent only if the WDT_WIRQWAKEEN[0] OVF_WK_ENA and/or the WDT_WIRQWAKEEN[1] DLY_WK_ENA bits enable the overflow and/or the delay wake-up capability.

22.3.4.2 Interrupts

Table 22-85 list the event flags, and their masks, that cause module interrupts.

Table 22-85. Watchdog Timer Events

| Event Flag | Event Mask | Mapping | Comments |
|---------------------------|-------------------------------------------|----------|------------------------------|
| WDT_WIRQSTAT[0] EVENT_OVF | WDT_WIRQENSET/WDT_WIRQENCLR[0] OVF_IT_ENA | WDTi_IRQ | Watchdog timer overflow |
| WDT_WIRQSTAT[1] EVENT_DLY | WDT_WIRQENSET/WDT_WIRQENCLR[1] DLY_IT_ENA | WDTi_IRQ | Watchdog delay value reached |

22.3.4.3 General Watchdog Timer Operation

The watchdog timers are based on an upward 32-bit counter coupled with a prescaler. The counter overflow is signaled through two independent signals: a simple reset signal and an interrupt signal, both active low. The use of these signals depends on whether they are connected or not. For this information, see Figure 22-15. The interrupt generation mechanism is controlled through the WDT_WIRQENSET/WDT_WIRQENCLR and WDT_WIRQSTAT registers.

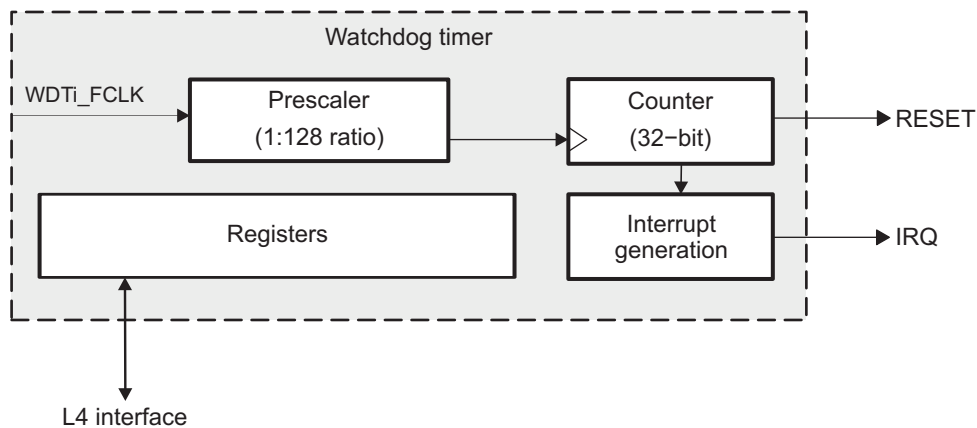

The prescaler ratio can be set from 1 to 128 by accessing the

WDT_WCLR[4:2] PTV bit field and the WDT_WCLR[5] PRE bit of the watchdog control register (WDT_WCLR).

The current timer value can be accessed on-the-fly by reading the watchdog timer counter register (WDT_WCRR), modified by accessing the watchdog timer load register (WDT_WLDR) (no on-the-fly update), or reloaded by following a specific reload sequence on the watchdog timer trigger register (WDT_WTGR). A start/stop sequence applied to the watchdog timer start/stop register (WDT_WSPR) can start and stop the watchdog timers.

Figure 22-17 is a functional block diagram of the watchdog timer.

Figure 22-17. 32-Bit Watchdog Timer Functional Block Diagram

timers-016

22.3.4.4 Reset Context

The watchdog timers are enabled after reset. Table 22-86 lists the default reset values of the two watchdog timer load registers (the WDT_WLDR) and prescaler ratios (the WDT_WCLR[4:2] PTV bit field). To get these values, software must read the corresponding WDT_WCLR[4:2] PTV bit field and the 32-bit register to retrieve the static configuration of the module.

Table 22-86. Count and Prescaler Default Reset Values

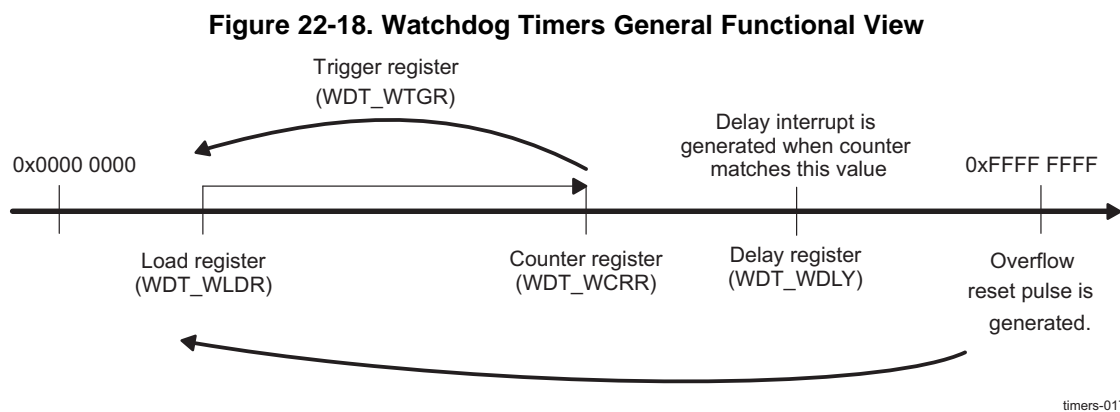

| Timer | WDT_WLDR Reset Value | PTV Reset Value |
|-----------------|----------------------|-----------------|
| MPU WDT (WDT2) | 0xFFFB 0000 | 0 |
| IVA3 WDT (WDT3) | 0xFFFB 0000 | 0 |

22.3.4.5 Overflow/Reset Generation

When the watchdog timer counter register ([WDT_WCRR](#)) overflows, an active-low reset pulse is generated to the PRCM module. This pulse is one prescaled timer clock cycle wide and occurs at the same time as the timer counter overflow.

After reset generation, the counter is automatically reloaded with the value stored in the watchdog load register ([WDT_WLDR](#)) and the prescaler is reset (the prescaler ratio remains unchanged). When the reset pulse output is generated, the timer counter begins incrementing again.

[Figure 22-18](#) shows a general functional view of the watchdog timers.

22.3.4.6 Prescaler Value/Timer Reset Frequency

Each watchdog timer is composed of a prescaler stage and a timer counter.

The timer rate is defined by the following values:

- Value of the prescaler fields (the [WDT_WCLR\[5\]](#) PRE bit and the [WDT_WCLR\[4:2\]](#) PTV bit field)
- Value loaded into the timer load register ([WDT_WLDR](#))

The prescaler stage is clocked with the timer clock and acts as a clock divider for the timer counter stage. The ratio is managed by accessing the ratio definition field (the [WDT_WCLR\[4:2\]](#) PTV bit field) and is enabled with the [WDT_WCLR\[5\]](#) PRE bit.

[Table 22-87](#) lists the prescaler clock ratio values.

Table 22-87. Prescaler Clock Ratio Values

| WDT_WCLR[5] PRE | WDT_WCLR[4:2] PTV | Clock Divider (PS) |
|---------------------------------|-----------------------------------|--------------------|
| 0 | X | 1 |
| 1 | 0 | 1 |
| 1 | 1 | 2 |
| 1 | 2 | 4 |
| 1 | 3 | 8 |
| 1 | 4 | 16 |
| 1 | 5 | 32 |
| 1 | 6 | 64 |
| 1 | 7 | 128 |

Thus the watchdog timer overflow rate is expressed as:

$$\text{OVF_Rate} = (0\text{x}\text{FFFF FFFF} - \text{WDT_WLDR} + 1) \times (\text{wd-functional clock period}) \times \text{PS}$$

where wd-functional clock period = $1/(\text{wd-functional clock frequency})$ and $\text{PS} = 2^{(\text{PTV})}$

CAUTION

Internal resynchronization causes some latency in any software write to [WDT_WSPR](#) before [WDT_WSPR](#) is updated with the programmed value:

$1.5 \times \text{functional clock cycles} \leq \text{write_WDT_WSPR_latency} \leq 2.5 \times \text{functional clock cycles}$

Remember to consider this latency whenever the watchdog timer must be started or stopped.

For example, for a timer clock input of 32 kHz with a prescaler ratio value of 0x1 (clock divided by 2) and [WDT_WCLR\[5\] PRE = 1](#) (clock divider enabled), the reset period is as listed in [Table 22-88](#).

Table 22-88. Reset Period Examples

| WDT_WLDR Value | Reset Period |
|--------------------------------|--------------|
| 0x0000 0000 | 74 h 56 min |
| 0xFFFF 0000 | 4 s |
| 0xFFFF FFF0 | 1 ms |
| 0xFFFF FFFF | 62.5 us |

CAUTION

- Ensure that the reloaded value allows the correct operation of the application. When a watchdog timer is enabled, software must periodically trigger a reload before the counter overflows. Hence, the value of the [WDT_WLDR\[31:0\]](#) bit field must be chosen according to the ongoing activity preceding the watchdog reload.
- Due to design reasons, [WDT_WLDR\[31:0\] = 0xFFFF FFFF](#) is a special case, although such a value of [WDT_WLDR](#) is meaningless. When [WDT_WLDR](#) is programmed with the overflow value, a triggering event generates a reset/interrupt one functional clock cycle later, even if the watchdog timer is stopped.

[Table 22-89](#) lists the default reset periods for the watchdog timers.

Table 22-89. Default Watchdog Timer Reset Periods

| Watchdog Timers | Clock Source | Default Reset Period |
|-----------------|--------------|----------------------|
| MPU/IVA3 WDTs | 32 kHz | 10 s |

22.3.4.7 Triggering a Timer Reload

To reload the timer counter and reset the prescaler before reaching overflow, a reload command is executed by accessing the watchdog timer trigger register ([WDT_WTGR](#)) using a specific reload sequence.

The specific reload sequence is performed whenever the written value on the [WDT_WTGR](#) register differs from its previous value. In this case, reload is executed in the same way as an overflow autoreload, but without the generation of a reset pulse.

The timer counter is loaded with the value of the watchdog timer load register (the [WDT_WLDR](#)[31:0] `TIMER_LOAD` bit field), and the prescaler is reset.

22.3.4.8 Start/Stop Sequence for Watchdog Timers (Using the [WDT_WSPR](#) Register)

To start and stop a watchdog timer, access must be made through the start/stop register ([WDT_WSPR](#)) using a specific sequence.

To disable the timer, follow this sequence:

1. Write 0xXXXX AAAA in [WDT_WSPR](#).
2. Write 0xXXXX 5555 in [WDT_WSPR](#).

To enable the timer, follow this sequence:

1. Write 0xXXXX BBBB in [WDT_WSPR](#).
2. Write 0xXXXX 4444 in [WDT_WSPR](#).

All other write sequences on the [WDT_WSPR](#) register have no effect on the start/stop feature of the module.

22.3.4.9 Modifying Timer Count/Load Values and Prescaler Setting

To modify the timer counter value (the [WDT_WCRR](#) register), prescaler ratio (the [WDT_WCLR](#)[4:2] `PTV` bit field), delay configuration value (the [WDT_WDLY](#)[31:0] `DLY_VALUE` bit field), or the load value (the [WDT_WLDR](#)[31:0] `TIMER_LOAD` bit field), the watchdog timer must be disabled by using the start/stop sequence (the [WDT_WSPR](#) register).

After a write access, the load register value and prescaler ratio registers are updated immediately, but new values are considered only after the next consecutive counter overflow or after a new trigger command (the [WDT_WTGR](#) register).

22.3.4.10 Watchdog Counter Register Access Restriction ([WDT_WCRR](#) Register)

A 32-bit shadow register is implemented to read a coherent value of the [WDT_WCRR](#) register because the [WDT_WCRR](#) register is directly related to the timer counter value and is updated on the timer clock ([WDT_FCLK](#)). The shadow register is updated by a 16-bit LSB read command.

NOTE: Although the L4 clock ([WDT_ICLK](#)) is completely asynchronous with the timer clock ([WDT_FCLK](#)), some synchronization is performed to ensure that the value of the [WDT_WCRR](#) register is not read while it is being incremented.

When 32-bit read access is performed, the shadow register is not updated. Read access is performed directly from the accessed register.

To ensure that a coherent value is read inside [WDT_WCRR](#), the first read access is to the lower 16 bits (offset = 0x08), followed by read access to the upper 16 bits (offset = 0x0A).

22.3.4.11 Watchdog Timer Interrupt Generation

When an interrupt source occurs, the interrupt status bit (the [WDT_WIRQSTAT](#)[0] `EVENT_OVF` or [WDT_WIRQSTAT](#)[1] `EVENT_DLY` bit) is set to 1. The output interrupt line ([WDTi_IRQ](#)) is asserted (active low) when status (the `EVENT_xxx` bit) and enable (the `xxx_IT_ENA` bit) flags are set to 1; the order is not relevant. Writing 1 to the enable bit (the status is already set at 1) also triggers the interrupt in the normal order (enable first, status next). The pending interrupt event is cleared when the set status bit is overwritten by a value of 1 by a write command in the [WDT_WIRQSTAT](#) register. Reading the [WDT_WIRQSTAT](#) register and writing the value back allows a fast interrupt acknowledge process.

The watchdog timer issues an overflow interrupt if this interrupt is enabled in the watchdog interrupt enable register ([WDT_WIRQENSET](#)[0] `OVF_IT_ENA` = 1). When the overflow occurs, the interrupt status bit (the [WDT_WIRQSTAT](#)[0] `EVENT_OVF` bit) is set to 1. The output interrupt line ([WDT_IRQ](#)) is asserted (active low) when status (`EVENT_OVF`) and enable (`OVF_IT_ENA`) flags are set to 1; the order is not relevant. This interrupt can be disabled by setting the [WDT_WIRQENCLR](#)[0] `OVF_IT_ENA` bit to 1.

The watchdog can issue the delay interrupt if this interrupt is enabled in the interrupt enable register ([WDT_WIRQENSET\[1\] DLY_IT_ENA = 1](#)). When the counter is running and the counter value matches the value stored in the delay configuration register ([WDT_WDLY](#)), the corresponding interrupt status bit is set in the watchdog status register ([WDT_WIRQSTAT](#)) and the output interrupt line is asserted (active low) when the flag ([EVENT_DLY](#)) and enable ([DLY_IT_ENA](#)) bits are 1 in the [WDT_WIRQSTAT](#) and [WDT_WIRQENSET](#) registers, respectively; the order (normally enable, then flag), is not relevant. This interrupt can be disabled by setting the [WDT_WIRQENCLR\[1\] DLY_IT_ENA](#) bit to 1.

NOTE: Writing 0 to the [WDT_WIRQSTAT\[0\] EVENT_OVF](#) bit or the [WDT_WIRQSTAT\[1\] EVENT_DLY](#) bit has no effect.

The two clock domains are resynchronized because the interrupt event is generated on the functional clock domain ([WDTi_FCLK](#)) during the updating of the interrupt status register ([WDT_WIRQSTAT](#)).

The [WDT_WDLY](#) register is used to specify the value of the delay configuration register. The delay time to interrupt is the difference between the reload value stored in the counter load register ([WDT_WLDR](#)) and the programmed value in this register ([WDT_WDLY](#)).

Use the following formula to estimate the delay time:

Delay time period = ([WDT_WDLY](#) – [WDT_WLDR](#) + 1) × Timer clock period × Clock divider

Where:

- Timer clock period = 1/(Timer clock frequency)
- Clock divider = 2PTV

If the counter value ([WDT_WCRR](#)) reaches the programmed value ([WDT_WDLY](#)), the status bit ([EVENT_DLY](#)) gets set in the interrupt status register ([WDT_WIRQSTAT](#)), and an interrupt occurs if the corresponding enable bit is set in the interrupt enable register ([WDT_WIRQENSET](#)).

CAUTION

If the reload event occurs (after a triggering sequence or after a reset sequence) before reaching the programmed value ([WDT_WDLY\[31:0\] WDLY_VALUE](#)), no interrupt is generated.

Also, no interrupt is generated if the value programmed in the delay configuration register ([WDT_WDLY](#)) is less than the value stored in the counter load register ([WDT_WLDR](#)).

22.3.4.12 Watchdog Timers Under Emulation

During emulation mode, the watchdog timer can/cannot continue running, according to the value of the [WDT_WDSC\[5\] EMUFREE](#) bit of the system configuration register ([WDT_WDSC](#)).

- When [EMUFREE](#) is 1, watchdog timer execution is not stopped and a reset pulse is still generated when overflow is reached.
- When [EMUFREE](#) is 0, the counters (prescaler/timer) are frozen and incrementation restarts after exiting from emulation mode.

22.3.4.13 Accessing Watchdog Timer Registers

Posted/nonposted selection applies only to functional registers that require synchronization on/from the timer functional clock domain ([WDTi_FCLK](#)). For write/read operation, the following registers are affected:

- [WDT_WCLR](#)
- [WDT_WCRR](#)
- [WDT_WLDR](#)
- [WDT_WTGR](#)
- [WDT_WDLY](#)

- [WDT_WSPR](#)

NOTE: To ensure completion of successive writes in a WDT2 or WDT3 functional clock domain register, user software must poll the appropriate WDT_WWPS status bit.

NOTE: To ensure coherent reading when a read transaction immediately follows a write access to a WDT2 or WDT3 functional clock domain register, user software must check the appropriate WDT_WWPS status bit.

The timer interface clock domain synchronous registers are not affected by the posted mode mechanism; the write/read operation is effective and acknowledged (command accepted) after one WDT_ICLK cycle from the command assertion. The timer interface clock domain synchronous registers are:

- [WDT_WIDR](#)
- [WDT_WDSC](#)
- [WDT_WDST](#)
- [WDT_WIRQSTATRAW](#)
- [WDT_WIRQSTAT](#)
- [WDT_WIRQENSET](#)
- [WDT_WIRQENCLR](#)
- [WDT_WIRQWAKEEN](#)
- [WDT_WWPS](#)

NOTE: Accesses to WDT2 and WDT3 functional clock domain synchronous registers are posted.

22.3.5 Watchdog Timer Low-Level Programming Model

This section covers the low-level hardware programming sequences for configuration and use of the module.

22.3.5.1 Global Initialization

22.3.5.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the watchdog timer is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the watchdog timer (see [Table 22-90](#)). For more information, see [Section 22.3.2](#), *Watchdog Timer Environment*, and [Section 22.3.3](#), *Watchdog Timer Integration*.

Table 22-90. Global Initialization of Surrounding Modules

| Surrounding Modules | Comments |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRCM | The module interface and functional clocks must be enabled. For more information about the module configuration, see Section 3.1.1.1.2 , <i>Module Level Clock Management</i> , in Chapter 3 , <i>Power, Reset, and Clock Management</i> . |
| Control module | Module-specific pad muxing must be set in the control module. For more information about the module configuration, see Section 18.4.8 , <i>PAD Functional Multiplexing and Configuration</i> in Chapter 18 , <i>Control Module</i> . |
| MPU INTC | The MPU INTC configuration must be performed to enable the interrupts from the watchdog timer. See Section 4.4.3 , <i>Interrupt Controller Registers</i> in Chapter 4 , <i>Cortex-A9 MPU Subsystem</i> . |

22.3.5.1.2 Watchdog Timer Module Global Initialization

22.3.5.1.2.1 Main Sequence – Watchdog Timer Module Global Initialization

Table 22-91 lists the steps for initializing the watchdog timer module when the module is to be used for the first time.

Table 22-91. Watchdog Timer Module Global Initialization

| Step | Register/Bit Field/Programming Model | Value |
|----------------------------|--------------------------------------|-------|
| Execute software reset. | WDT_WDSC[1] SOFTRESET | 0x1 |
| Wait until reset release? | WDT_WDSC[1] SOFTRESET | 0x0 |
| Configure idle mode. | WDT_WDSC[4:3] IDLEMODE | xx |
| Enable delay wakeup. | WDT_WIRQWAKEEN[1] DLY_WK_ENA | 0x1 |
| Enable overflow wakeup. | WDT_WIRQWAKEEN[0] OVF_WK_ENA | 0x1 |
| Enable delay interrupt. | WDT_WIRQENSET[1] ENABLE_DLY | 0x1 |
| Enable overflow interrupt. | WDT_WIRQENSET[0] ENABLE_OVF | 0x1 |

22.3.5.2 Operational Mode Configuration

22.3.5.2.1 Watchdog Timer Basic Configuration

22.3.5.2.1.1 Main Sequence – Watchdog Timer Basic Configuration

Table 22-92 lists the steps for the basic configuration of the watchdog timer.

Table 22-92. Watchdog Timer Basic Configuration

| Step | Register/Bit Field/Programming Model | Value |
|---------------------------------|--------------------------------------|-------|
| Disable the watchdog timer. | See Section 22.3.5.2.1.2. | |
| Set prescaler value. | WDT_WCLR[4:2] PTV | xxx |
| Enable prescaler. | WDT_WCLR[5] PRE | 0x1 |
| Load delay configuration value. | WDT_WDLY | xxx |
| Load timer counter value. | WDT_WCRR | xxx |
| Enable the watchdog timer. | See Section 22.3.5.2.1.3. | |

22.3.5.2.1.2 Subsequence – Disable the Watchdog Timer

Table 22-93 lists the steps to disable the watchdog timer.

Table 22-93. Disable the Watchdog Timer

| Step | Register/Bit Field/Programming Model | Value |
|-------------------------------|--------------------------------------|-------------|
| Write disable sequence Data1. | WDT_WSPR | 0xXXXX AAAA |
| Write disable sequence Data2. | WDT_WSPR | 0xXXXX 5555 |

22.3.5.2.1.3 Subsequence – Enable the Watchdog Timer

Table 22-94 lists the steps to enable the watchdog timer.

Table 22-94. Enable the Watchdog Timer

| Step | Register/Bit Field/Programming Model | Value |
|------------------------------|--------------------------------------|-------------|
| Write enable sequence Data1. | WDT_WSPR | 0xXXXX BBBB |
| Write enable sequence Data2. | WDT_WSPR | 0xXXXX 4444 |

22.3.6 Watchdog Timer Register Manual

22.3.6.1 Watchdog Timer Instance Summary

Table 22-95 lists the base address and address space for the watchdog timer module instances.

Table 22-95. Watchdog Timer Instance Summary

| Module Name | Base Address L4 Interconnect | Base Address L3 Interconnect | Base Address Cortex-A9 Private Access | Base Address DSP Private Access | Size |
|-------------|---------------------------------|---------------------------------|---------------------------------------------|---------------------------------------|------|
| WDTIMER2 | 0x4A31 4000 | - | - | - | 4KB |
| WDTIMER3 | - | 0x4903 0000 | 0x4013 0000 | 0x01D3 0000 | 4KB |

NOTE: Private access is an access which is not using the L3/L4 interconnects.

22.3.6.2 Watchdog Timer Registers

22.3.6.2.1 Watchdog Timer Register Summary

CAUTION

The watchdog timers registers are limited to 32-bit and 16-bit data accesses; 8-bit access is not allowed and can corrupt register content.

Table 22-96 lists the WDTIMER2 registers.

Table 22-96. WDTIMER2 Register Mapping Summary

| Register Name | Type | Register Width (Bits) | Address Offset | Physical Address L4 Interconnect |

22.4 32-kHz Synchronized Timer

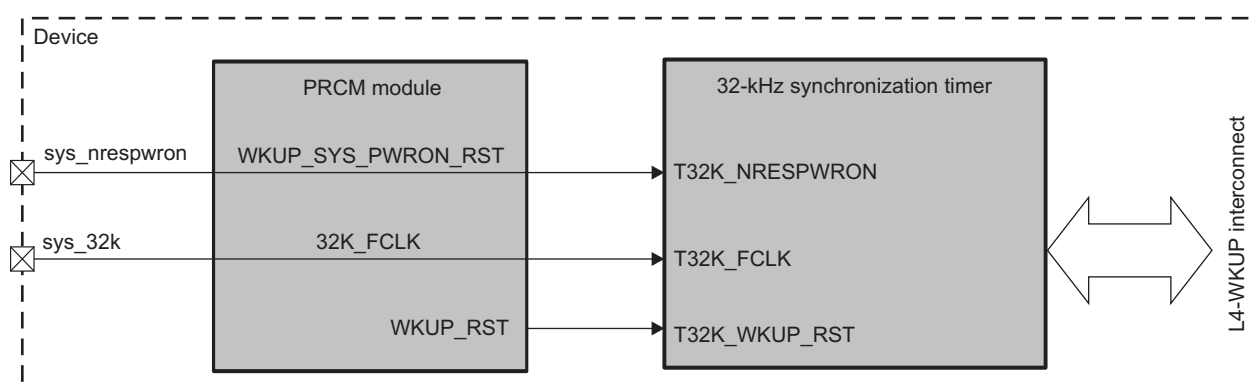

22.4.1 32-kHz Synchronized Timer Overview

The 32-kHz synchronized timer is a 32-bit counter clocked by the falling edge of the 32-kHz system clock. It is reset while the external asynchronous power-up reset (`sys_nrespwron`) primary input/output (I/O) is active (main device reset). When `sys_nrespwron` is released (on the rising edge of `sys_nrespwron`), after three 32-kHz clock periods, the counter starts counting up from the reset value of the counter register on the falling edge of the 32-kHz system clock. After reaching its highest value, the counter wraps back to 0 and starts counting again.

Figure 22-19 is the block diagram of the 32-kHz synchronized timer.

NOTE: `sys_nrespwron` is an active-low I/O.

Figure 22-19. 32-kHz Synchronized Timer Block Diagram

timers-018

22.4.1.1 32-kHz Synchronized Timer Features

The main features of the 32-kHz synchronized timer controller are:

- L4 slave interface support:
 - 32-bit data bus width
 - 32-/16-bit access supported
 - 8-bit access not supported
 - 5-bit address bus width
 - Burst mode not supported
- Only read operations are supported on the module registers; no write operation is supported (no error/no action on write).
- Free-running 32-bit upward counter
- Start and keep counting after power-on reset
- Automatic roll over to 0; highest value reached: 0xFFFF FFFF
- On-the-fly read (while counting)

22.4.2 32-kHz Synchronized Timer Environment

The synchronized timer is accessible only through the L4 interface.

22.4.3 32-kHz Synchronized Timer Integration

Table 22-134 through Table 22-136 summarize the integration of the module in the device.

22.4.4 32-kHz Synchronized Timer Functional Description

The synchronized timer is a counter that starts on the rising edge of an external asynchronous signal (sys_nrespwron). When sys_nrespwron is released (on the rising edge of sys_nrespwron), the counter starts counting up from the reset value of the counter register on the falling edge of the 32-kHz system clock after three inverted 32-kHz clock periods. After reaching its highest value, the counter wraps back to 0 and starts counting again with no additional delay. When sys_nrespwron is released (on the rising edge of sys_nrespwron), after three inverted 32-kHz clock periods, the counter starts counting up from the reset value of the counter register on the falling edge of the 32-kHz system clock.

Figure 22-20 shows the reset synchronization timing diagram. After reaching its highest value, the counter wraps back to 0 and starts counting again without any extra delay.

Figure 22-20. Reset Resynchronization Timing Diagram

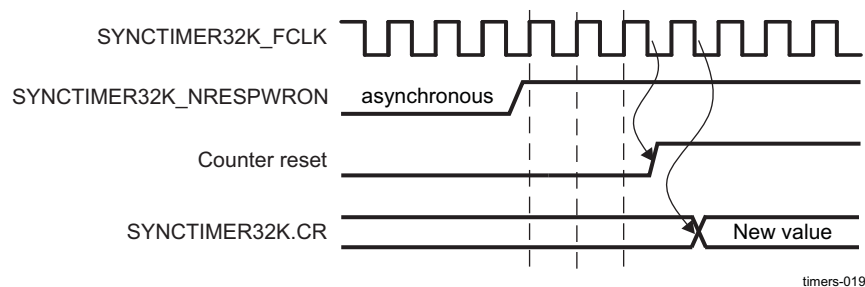

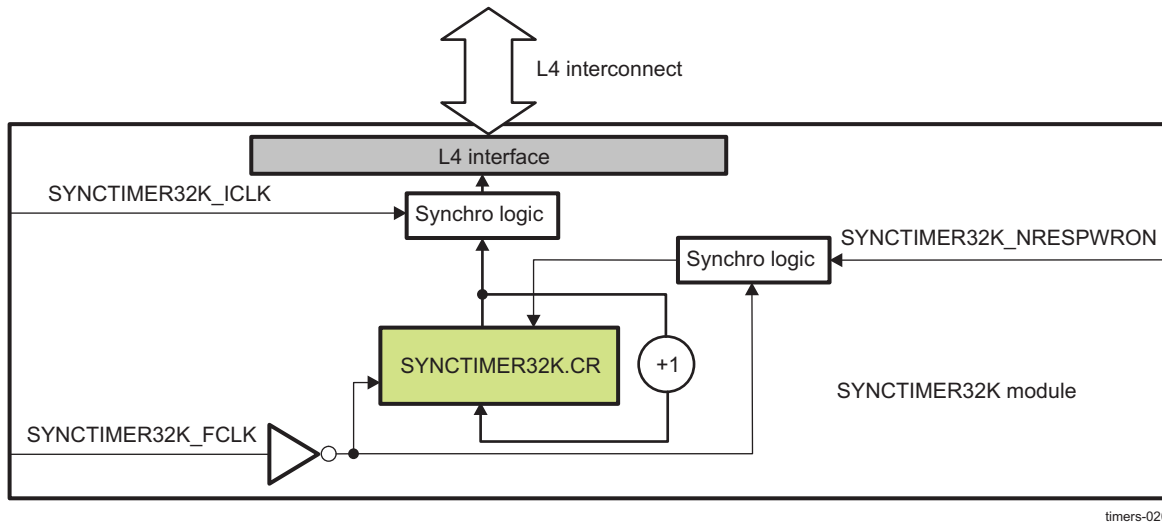

Figure 22-21 is the block diagram of the synchronized timer.

NOTE: sys_nrespwron is an active-low input.

Figure 22-21. SYNCTIMER32K Block Diagram

The sync logic ensures the read transaction correctness by synchronizing the counter register read access on 32KSYNCNT_ICLK because the 32KSYNCNT_ICLK clock signal is completely asynchronous with S32KSYNCNT_FCLK. The sys_nrespwron input resets the counter register (32KSYNCNT_CR). The inverted 32KSYNCNT_FCLK clocks the sys_nrespwron reset signal.

22.4.4.1 Reading the 32-kHz Synchronized Timer

The counter register (32KSYNCNT_CR) is 32 bits wide and can be read using 32-bit and 16-bit access. For correct count capture using 16-bit access, it must be accessed as 16-bit LSB access first and 16-bit MSB access next. The internal logic ensures the integrity and correctness of the read data from 32KSYNCNT_CR when it is split into 16-bit data. The read data corresponds to the data when the read command is issued. Internal synchronization logic allows reading of the counter value with 32KSYNCNT_ICLK while the counter is running. There is a read latency, which is a synchronization delay and is one 32KSYNCNT_ICLK clock cycle. The time latency to read the synchronized counter register is minimum one read cycle for 32-bit access and two read cycles for 16-bit access, where each read cycle is equal to three 32KSYNCNT_ICLK clock cycles.

22.4.5 32KTimer Register Manual

Table 22-137 lists the base address and block size for the 32-kHz synchronized timer. It is memory mapped to the L4 peripheral bus memory space.

Table 22-137. 32KTimer Instance Summary

| Module Name | Base Address L4 Interconnect | Size |
|-------------|---------------------------------|------|
| 32KTimer | 0x4A30 4000 | 4KB |

22.4.5.1 32KTimer Register Mapping Summary

CAUTION

The 32-kHz synchronized timer registers are limited to 32-bit and 16-bit data accesses; 8-bit access is not allowed and can corrupt the register content.

Table 22-138 lists the 32-kHz synchronized timer registers. through describe the register bits.

| 23.13 Full-Speed USB Host Controller | 5359 |

23.1 Multimaster High-Speed I²C Controller

23.1.1 HS I²C Overview

The device contains four multimaster high-speed (HS) inter-integrated circuit (I²C™) controllers (I2Ci modules, where i = 1, 2, 3, 4), each of which provides an interface between a local host (LH), such as a digital signal processor (DSP), and any I²C-bus-compatible device that connects through the I²C serial bus. External components attached to the I²C bus can serially transmit and receive up to 8 bits of data to and from the LH device through the 2-wire I²C interface.

Each multimaster HS I²C controller can be configured to act like a slave or master I²C-compatible device. Moreover, each multimaster HS I²C controller can be configured in serial camera control bus (SCCB) mode (the SCCB is a serial bus developed by Omnivision Technologies, Inc.) to act as a master on a 2-wire SCCB bus. Only multimaster HS I²C controllers I2C2 and I2C3 can be configured in SCCB mode to act as a master device on a 3-wire SCCB bus.

The device contains a fifth master transmitter HS I²C interface (I2C5) in the power, reset, and clock management (PRCM) module to perform dynamic voltage control and power sequencing with an external power integrated circuit (IC).

[Figure 23-1](#) shows the HS I²C controllers.

Figure 23-1. HS I²C Controllers

The four multimaster HS I²C controllers have the following features:

- Compliant with Philips I²C specification version 2.1
- Supports standard mode (up to 100 Kbps) and fast mode (up to 400 Kbps)
- Supports HS mode for transfer up to 3.4 Mbps

- Support for 3-wire/2-wire SCCB master mode for I2C2 and I2C3 modules, 2-wire SCCB master mode for I2C1 and I2C4 modules, up to 100 Kbps
- 7-bit and 10-bit device addressing modes
- General call
- Start/restart/stop
- Multimaster transmitter/slave receiver mode
- Multimaster receiver/slave transmitter mode
- Combined master transmit/receive and receive/transmit mode
- Built-in configurable FIFOs (8, 16, 32, 64 bytes) for buffered read or write
- Module enable/disable capability
- Programmable multislave channel (responds to four separate addresses)
- Programmable clock generation
- 8-bit-wide data access
- Open-core protocol (OCP) interface with LH application (OCP-IP 2.0 compliant)
- Designed for low power consumption
- Implement Auto Idle mechanism
- Implement Idle Request/Idle Acknowledge handshake mechanism
- Support for asynchronous wake-up mechanism
- Two direct memory access (DMA) channels
- Wide interrupt capability
- Supports OmniVision SCCB protocol
- Compliant with Highlander 0.8

The master transmitter HS I²C controller I2C5 has the following features:

- Support of HS and fast modes
- 7-bit addressing mode only
- Master transmitter mode only
- Start/restart/stop

NOTE: Before using HS I²C mode, determine that the target device supports this mode.

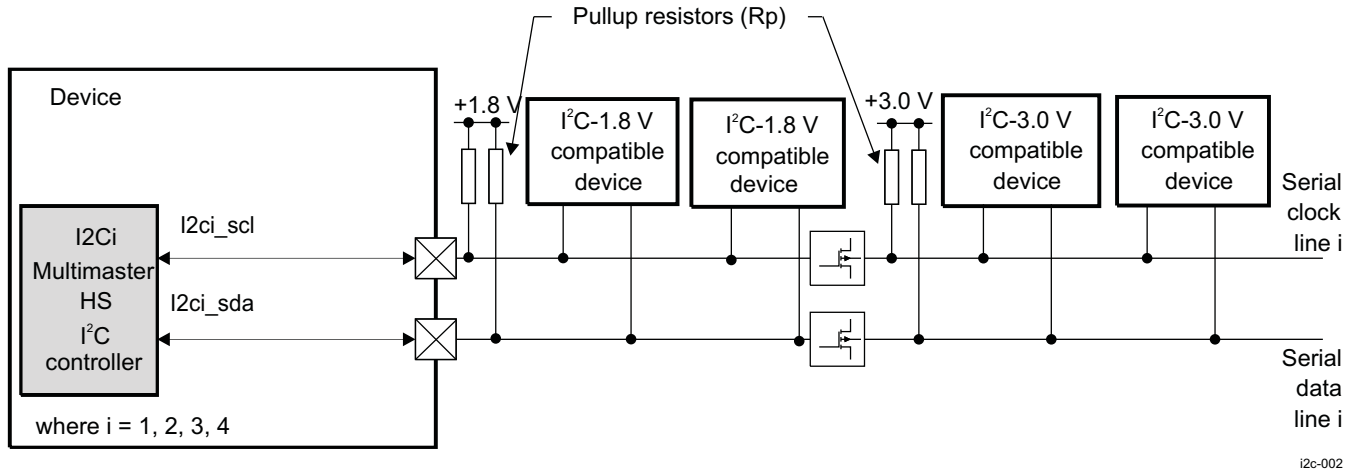

23.1.2 HS I²C Environment

This section describes the HS I²C application fields from an environment point of view (external connections). It describes HS I²C connectivity options, lists all possible interfaces, and describes the protocol and data format used in each case.

23.1.2.1 HS I²C in I²C Mode

Figure 23-2 shows the multimaster HS I²C controllers and their related connections with I²C-compliant devices in I²C mode.

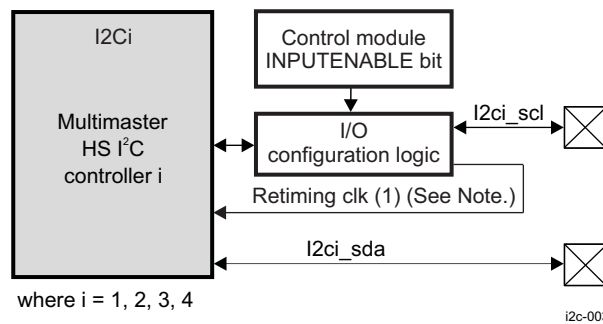

Figure 23-2. HS I²C and Typical Connections to I²C Devices

23.1.2.1.1 HS I²C Pins for Typical Connections in I²C Mode

Figure 23-3 shows the multimaster HS I²C controller pins used for typical connections with I²C devices.

Figure 23-3. HS I²C Interface Signals in I²C Mode

NOTE: In master mode, the clock signal (IP clk configured as output) is also used as retiming input (the INPUTENABLE bit in the corresponding pad configuration register must be set to 1).

23.1.2.1.2 HS I²C Interface Typical Connections

Table 23-1 lists the pins associated with the I²C interface.

Table 23-1. HS I²C Input/Output

| Signal | I/O ⁽¹⁾ | Description | Reset Value |
|----------|--------------------|-----------------------------------------------------------------------------------------------------------------------|-------------|
| i2ci_scl | I/O | I ² C serial clock line ⁽²⁾ . Open-drain output buffer. Requires external pullup resistor (Rp). | 1 |

⁽¹⁾ I = Input; O = Output

⁽²⁾ This output signal is also used as retiming input (the INPUTENABLE bit in the corresponding pad configuration register must be set to 1).

Table 23-1. HS I²C Input/Output (continued)

| Signal | I/O ⁽¹⁾ | Description | Reset Value |
|----------|--------------------|------------------------------------------------------------------------------------|-------------|
| i2ci_sda | I/O | I ² C serial data line. Open-drain output buffer. Requires external Rp. | 1 |

23.1.2.1.3 HS I²C Typical Connection Protocol and Data Format

23.1.2.1.3.1 HS I²C Serial Data Format

The I²C controller operates in 8-bit word data format (byte write access supported for the last access). Each byte transmitted or received on the serial data line is 8 bits long. The number of bytes that can be transmitted or received is not restricted. The data is transferred with the most-significant bit (MSB) first. In receiver mode, each byte is followed by an acknowledge bit from the I²C. Figure 23-4 shows a typical I²C communication format.

Figure 23-4. HS I²C Data Transfer

i2c-004

23.1.2.1.3.2 HS I²C Data Validity

The data on the serial data line (SDA) must be stable during the high period of the serial clock line. The high and low states of the data line can change only when the clock signal on the serial clock line (SCL) is low.

Figure 23-5 is an example of data validity requirements.

Figure 23-5. HS I²C Bit Transfer on the I²C Bus

i2c-005

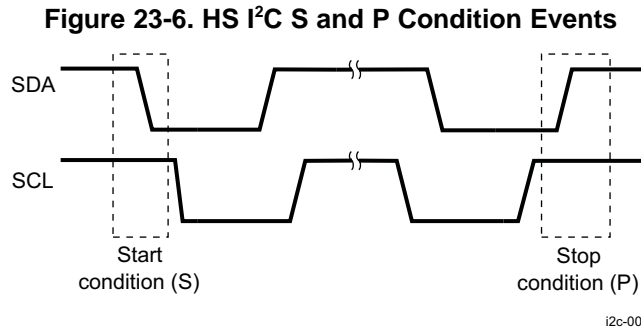

23.1.2.1.3.3 HS I²C Start and Stop Conditions

The I²C module generates start (S) and stop (P) conditions when it is configured as a master.

- An S condition is a high-to-low transition on the serial data line while serial clock line is high.
- A P condition is a low-to-high transition on the serial data line while serial clock line is high.

The bus is considered busy after the S condition (the I2Ci.I2C_STAT[12] BB bit is 1 to indicate that the bus is busy) and free after the P condition (the I2Ci.I2C_STAT[12] BB bit is 0 to indicate that the bus is free).

Figure 23-6 shows the waveforms that occur during an S and a P condition.

23.1.2.1.3.4 HS I²C Addressing

The I²C module supports two data formats in fast/standard (F/S) and HS modes:

- 7-bit/10-bit addressing format
- 7-bit/10-bit addressing format with repeated start (Sr) condition

23.1.2.1.3.4.1 Data Transfer Formats in F/S Mode

Figure 23-7 shows the I²C data transfer formats in F/S mode.

Figure 23-7. HS I²C Data Transfer Formats in F/S Mode

(a) 7-bit addressing format

(b) 10-bit addressing format

(c) Addressing format with repeated start condition

i2c-007

The first word after an S condition consists of 8 bits. In acknowledge mode, an extra dedicated acknowledgment bit is inserted after each byte.

In addressing formats with 7-bit addresses, the first byte is composed of 7 MSB slave address bits and 1 least-significant bit (LSB) R/W_ bit.

The LSB R/W_ bit of the address byte indicates the transmission direction of the data bytes that follow it. If R/W_ is 0, the master writes data to the selected slave; if it is 1, the master reads data from the slave.

In addressing formats with 10-bit addresses, the structure of the first byte is 11110XXY, where XX is the 2 MSBs of the 10-bit addresses, and Y is the R/W_ bit. If the R/W_ bit is 0, the next byte contains the last 8 bits of the slave address. If the R/W_ bit is 1, the next byte contains data transmitted from the slave to the master.

23.1.2.1.3.4.2 Data Transfer Format in HS Mode

Figure 23-8 shows the I²C data transfer format in HS mode.

Figure 23-8. HS I²C Data Transfer in HS Mode

S = Start; Sr = repeated start; P = Stop; F/S = Fast/standard mode; HS = High-speed mode

i2c-008

Each multimaster HS I²C controller can also operate in HS mode. In this case, after the S condition, the module, which is in F/S mode, writes the master code address (000001XXX, where XXX is the variable portion of the master code) on the bus. No device connected on the same bus acknowledges this address. The module switches the clock to the HS clock and after an Sr condition, and sends the slave address and the data, as shown in Figure 23-8.

23.1.2.1.3.5 HS I²C Master Transmitter

In master transmitter mode, data assembled in one of the previously described data formats is shifted out on the serial data line SDA in sync with the self-generated clock pulses on the serial clock line SCL. The clock pulses are inhibited and SCL is held low when the intervention of the processor is required (XUDF) after a byte is transmitted.

23.1.2.1.3.6 HS I²C Master Receiver

Master receiver mode can be entered only from master transmitter mode. With any of the address formats (a), (b), or (c) (see Figure 23-7), if R/W_ is high, the module enters master receiver mode after the slave address byte and bit R/W_ are transmitted. Serial data bits received on bus line SDA are shifted in synchronization with the self-generated clock pulses on SCL.

23.1.2.1.3.7 HS I²C Slave Transmitter

Slave transmitter mode can be entered only from slave receiver mode. With any of the address formats (a), (b), or (c) (see Figure 23-7), the slave transmitter is entered if the slave address byte is the same as its own address and bit R/W_ is transmitted, if R/W_ is high. The slave transmitter shifts the serial data out on the data line SDA in sync with the clock pulses that are generated by the master device. It does not generate the clock but it can hold clock line SCL low while intervention of the LH is required (XUDF).

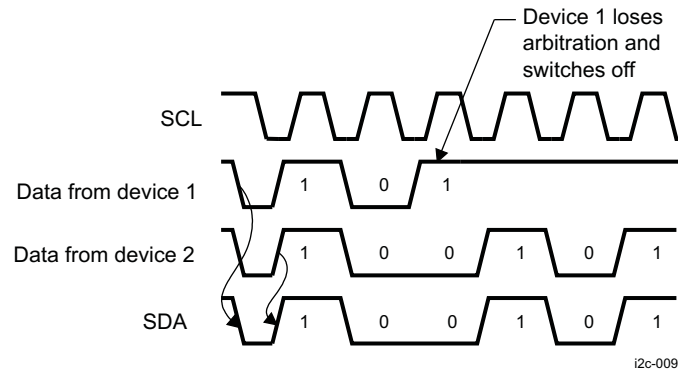

23.1.2.1.3.8 HS I²C Slave Receiver

In this mode, serial data bits received on the bus line SDA are shifted-in in sync with the clock pulses on SCL that are generated by the master device. It does not generate the clock but it can hold clock line SCL low while intervention of the LH is required (ROVR) after a byte is received.

23.1.2.1.3.9 HS I²C Bus Arbitration

If two or more master transmitters start a transmission on the same bus almost simultaneously, an arbitration procedure is invoked. The arbitration procedure uses the data presented on the serial bus by the competing transmitters. When a transmitter senses that a high signal it has presented on the bus has been overruled by a low signal, it switches to the slave receiver mode, sets the arbitration lost (AL) flag, and generates the arbitration lost interrupt. Figure 23-9 shows the arbitration procedure between two devices. The arbitration procedure gives priority to the device that transmits the serial data stream with the lowest binary value. If two or more devices send identical first bytes, arbitration continues on the subsequent bytes.

Figure 23-9. HS I²C Arbitration Between Master Transmitters

23.1.2.1.3.10 HS I²C Clock Generation and Synchronization

Under normal conditions, only one master device generates the clock signal, SCL. During the arbitration procedure, however, there are two or more master devices and the clock must be synchronized so that the data output can be compared. The wired-AND property of the clock line means that a device that first generates a low period of the clock line overrules the other devices. At this high/low transition, the clock generators of the other devices are forced to start generating their own low period. The clock line is then held low by the device with the longest low period, while the other devices that finish their low periods must wait for the clock line to be released before starting their high periods. A synchronized signal on the clock line is thus obtained, where the slowest device determines the length of the low period and the fastest device determines the length of the high period. If a device pulls down the clock line for a longer time, the result is that all clock generators must enter the WAIT-state. In this way a slave can slow down a fast master and the slow device can create enough time to store a received byte or prepare a byte to be transmitted (Clock Stretching).

NOTE: In case the SCL or SDA lines are stuck low, the Bus Clear operation is supported.

If the clock line (SCL) is stuck low, the preferred procedure is to reset the bus using the hardware reset signal if your I²C devices have hardware reset inputs. If the I²C devices do not have hardware reset inputs, cycle power to the devices to activate the mandatory internal power-on reset (POR) circuit.

If the data line (SDA) is stuck low, the master should send nine clock pulses. The device that held the bus low should release it sometime within those nine clocks. If not, then use the hardware reset or cycle power to clear the bus.

Figure 23-10 shows clock synchronization.

Figure 23-10. HS I²C Clock Generators Synchronization

i2c-010

23.1.2.1.3.11 HS I²C External Clock Configuration

Each multimaster HS I²C controller is clocked with an independent functional clock (I2Ci_FCLK) and an interface clock (I2Ci_ICLK) for interfacing with the L4_PER interconnect. These clocks are provided by the APE PRCM module for I2Ci (where i = 1, 2, 3, 4).

The SYS_CLK clock provided by the clock generator of the PRCM module is connected to the functional and interface clocks of the HS I²C controller I2C5. For detailed information about the module clocking, see [Chapter 3, Power, Reset, and Clock Management](#).

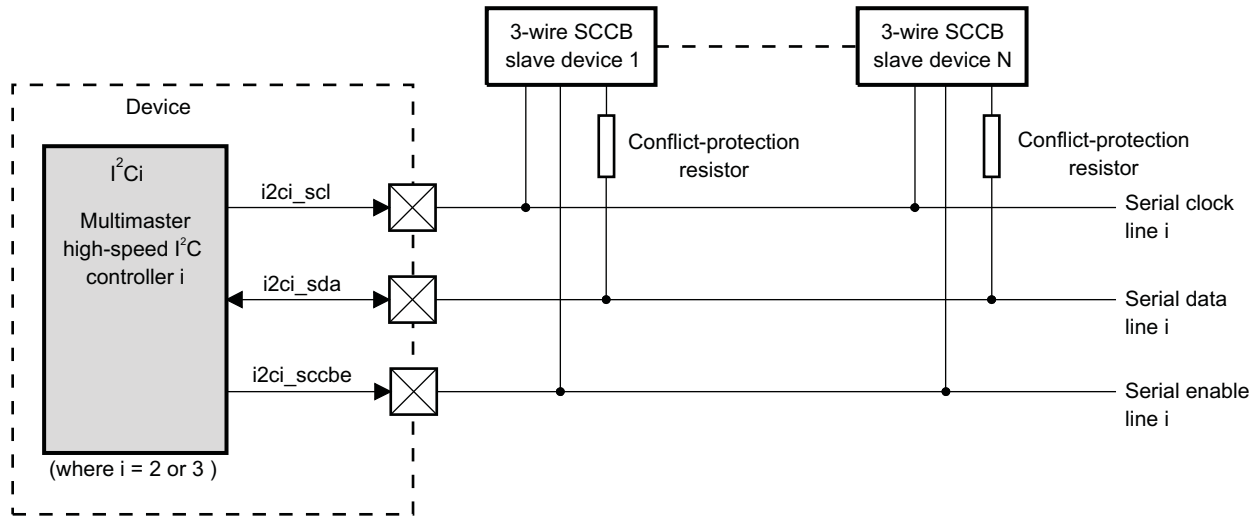

The functional clock is processed by a prescaler block to produce the internal sampling clock. This clock is generated by the I²C prescaler block. The prescaler block consists of the I2Ci.I2C_PSC[7:0] PSC bit field (where i = 1, 2, 3, 4) that is used to divide down the functional clock to obtain an internal sampling clock with a frequency value of $I2Ci_FCLK / (I2Ci.I2C_PSC[7:0] \text{ PSC bit field value} + 1)$, where i = 1, 2, 3, 4).

NOTE: The I2Ci.I2C_PSC[7:0] PSC bit field (where i = 5) of I2C5 is not accessible by software.

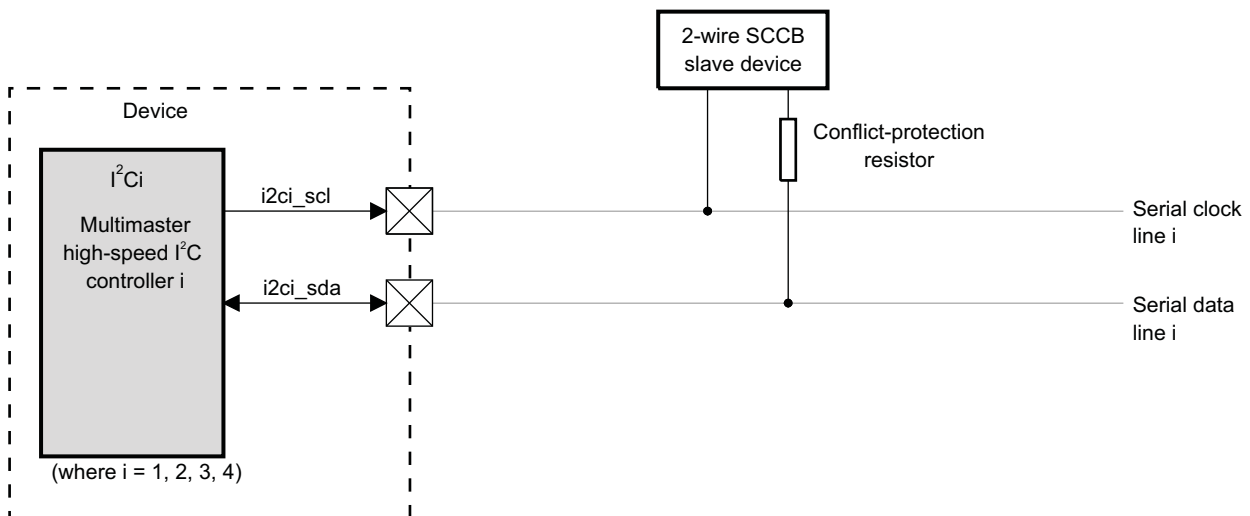

23.1.2.2 HS I²C in SCCB Mode

The multimaster HS I²C controllers support the 2-wire SCCB protocol in master mode as listed in [Figure 23-11](#). Only I2C2 and I2C3 support the 3-wire SCCB protocol in master mode.

Figure 23-11. HS I²C and Typical Connections to SCCB Devices

(a) Typical connection with 3-wire SCCB devices

(b) Typical connection with 2-wire SCCB devices

I2C-011

NOTE: Only one 2-wire SCCB slave device can be connected to the 2-wire SCCB bus.

23.1.2.2.1 HS I²C Pins for Typical Connections in SCCB Mode

Figure 23-12 shows the multimaster HS I²C controller pins used for typical connections with 3-wire or 2-wire SCCB devices.

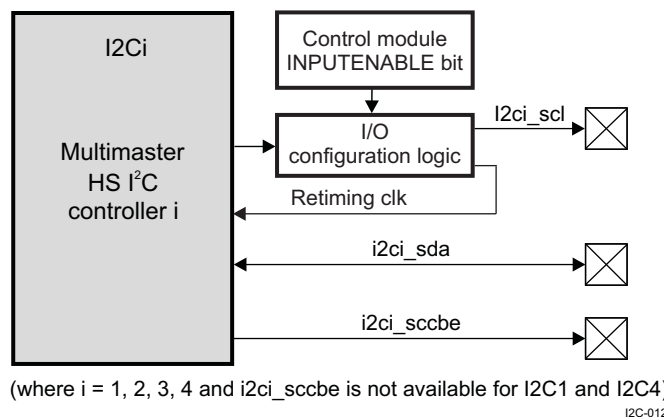

Figure 23-12. HS I²C Interface Signals in SCCB Mode**23.1.2.2.2 HS I²C SCCB Interface Typical Connections**

Table 23-2 lists the pins associated with the SCCB interface.

Table 23-2. HS I²C Input/Output

| Signal | I/O ⁽¹⁾ | Description | Reset Value ⁽²⁾ | I2Ci.I2C_CON[15] I2C_EN bit = 0 |
|--------------------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|------------------------------------|
| i2ci_scl | O | SCCB serial clock line ⁽³⁾ . Standard CMOS output buffer. | Hi-Z | High |
| i2ci_sda | I/O(OD) | SCCB serial data line. Standard CMOS 3-state output buffer. Requires external conflict-protection resistor for each slave device connected to the bus. | Hi-Z | Hi-Z |
| i2ci_sccb ⁽⁴⁾ | O | SCCB enable line. Standard CMOS output buffer. | High | High |

⁽¹⁾ I = Input; O = Output; OD = Open Drain

⁽²⁾ Hi-Z = High Impedance

⁽³⁾ This output signal is also used as retiming input (the INPUTENABLE bit in the corresponding pad configuration register must be set to 1).

⁽⁴⁾ This signal is used for the 3-wire SCCB protocol only.

NOTE: Because they share the same ball, the i2c2_sccb and i2c3_sccb signals are not available at the same time. For detailed information about pin configuration, see [Chapter 18, Control Module](#).

I2C1 and I2C4 do not provide any i2c1_sccb signal at the chip boundary of the device; thus, these modules do not support the 3-wire SCCB protocol.

23.1.2.2.3 HS I²C SCCB Typical Connection Protocol and Data Format

23.1.2.2.3.1 HS I²C SCCB Data Format

If the module is configured in SCCB mode of operation, the data format of transmissions appears as shown in Figure 23-13. For SCCB protocol compatibility I²C provides one more signal, SCCB_E, which acts like a transaction enable signal.

Figure 23-13. HS I²C 3-wire SCCB Transmission Timing Diagram

i2c-013

NOTE: When operating in 2-wire SCCB mode, the i2ci_sccb_e signal is not used by the 2-wire SCCB-compliant slave device attached to the 2-wire SCCB bus.

23.1.2.2.3.2 HS I²C SCCB Transmission Data Formats

Figure 23-14 describes the data format of the three kinds of transmission.

Figure 23-14. HS I²C SCCB Transmission Data Formats

R/W: 0 = Write, 1 = Read

X: don't care

NA: ninth bit of a read phase. This bit must be set to 1 by the master device.

i2c-014

The basic element of a data transmission is a phase. A phase contains 9 bits, which consist of an 8-bit sequential data transmission followed by a ninth bit. The ninth bit is a don't-care bit (X) or an NA bit, depending on whether the data transmission is a write or a read. The maximum number of phases that can be included in a transmission is three. The MSB is always asserted first for each phase.

A data transmission is one of three types:

- 3-phase write transmission:

The 3-phase write transmission cycle (see (a) of [Figure 23-14](#)) is a full write operation in which the master can write 1 byte of data to a specific slave(s). The 7-bit slave address in the ID value identifies the specific slave that the master intends to access. The subaddress identifies the register location of the specified slave. The write data contains 8-bit data that the master intends to write over the content of this specific address. The ninth bit of each of the three phases is a don't-care bit (X bit).

- 2-phase write transmission:

The 2-phase write transmission cycle is followed by a 2-phase read transmission cycle (see the following bullet). The purpose of issuing a 2-phase write transmission cycle (see (b) of [Figure 23-14](#)) is to identify the subaddress of some specific slave from which the master intends to read data for the following 2-phase read transmission cycle. The ninth bit of each phase is a don't-care bit (X bit).

- 2-phase read transmission:

Either a 3-phase or a 2-phase write transmission cycle must be asserted ahead of a 2-phase read transmission cycle. The 2-phase read transmission cycle (see (c) of [Figure 23-14](#)) cannot identify the subaddress. The 2-phase write transmission cycle contains read data of 8 bits and a ninth don't-care bit or NA bit. The master must drive the NA bit at logical 1.

In each transmission type, phase 1 (the 7-bit slave address of the ID value) is asserted by the master to identify the selected slave to which the data is read or written. Each slave has a unique 7-bit slave address. The 7-bit slave address of the ID value comprises 7 bits, from bit 7 to bit 1, that can identify up to 128 slaves. The eighth bit, bit 0, is the read/write selector bit that specifies the transmission direction of the current cycle. A logical 0 represents a write cycle and a logical 1 represents a read cycle. The ninth bit of phase 1 is a don't-care bit (X bit).

Phase 2 (subaddress/read data) is asserted by the master (subaddress) or the slave(s) (read data). A phase 2 transmission asserted by the master identifies the subaddress of the slave(s) the master intends to access. A phase 2 transmission asserted by the slave(s) indicates the read data that the master will receive. The slave(s) recognize the subaddress of this read data according to the previous 3-phase or 2-phase write transmission cycle. The ninth bit is defined as a don't-care bit (X bit) when the master asserts phase 2. The ninth bit is defined as an NA bit when the slave(s) asserts the phase 2 transmission. The master is responsible for a logical 1 during the period of the NA bit.

Phase 3 (write data) is asserted only by the master. This phase contains the data the master intends to write to the slave(s). Because the master asserts the transmission, the ninth bit of the phase 3 transmission is defined as a don't-care bit (X bit).

NOTE: A multimaster HS I²C controller configured in SCCB mode can perform two operations:

- Write a single byte to an SCCB slave device by using the 3-phase write transmission cycle
 - Read a single byte from an SCCB slave device by using the 2-phase write transmission cycle followed by the 2-phase read transmission cycle
-

23.1.2.2.3.3 HS I²C Data Validity

The data validity is the same as described in [Section 23.1.2.1.3.2, HS I²C Data Validity](#).

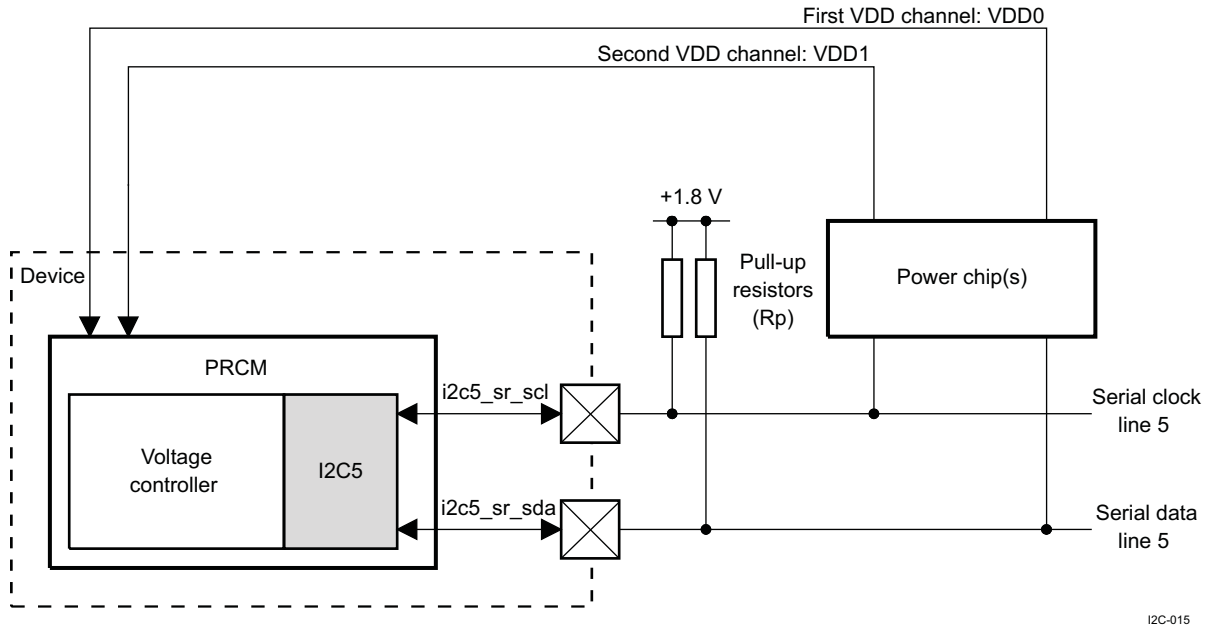

23.1.2.2.3.4 HS I²C S and P Conditions

The S and P conditions are the same as described in [Section 23.1.2.1.3.3, HS I²C Start and Stop Conditions](#).

23.1.2.3 HS I²C for Communication With Power Chip(s)

Figure 23-15 shows a typical connection between the master transmitter HS I²C controller I2C5 of the device and external power chip(s).

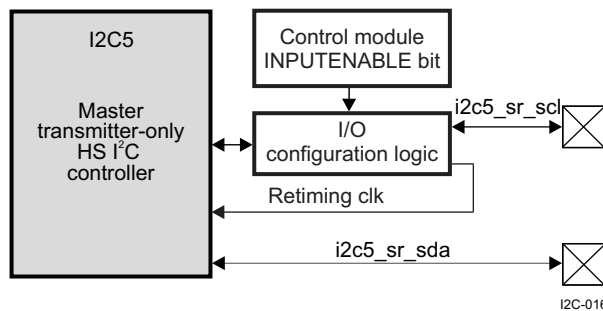

Figure 23-15. HS I²C and Typical Connection Between the HS I²C and Power Chip(s)

23.1.2.3.1 HS I²C I2C5 Pins for Typical Connections

Figure 23-16 shows the HS I²C controller I2C5 pins used for typical connections with power chips.

Figure 23-16. HS I²C I2C5 Interface Signals

23.1.2.3.2 HS I²C I2C5 Interface Typical Connections

The master transmitter HS I²C controller I2C5 interfaces between the device and external power chip(s) for voltage control. This module is always configured as an I²C master transmitter; it does not support the SCCB protocol.

Table 23-3 lists the pins associated with the I²C interface of the HS I²C controller I2C5 of the device.

Table 23-3. HS I²C Input/Output Description

| Signal | I/O ⁽¹⁾ | Description | Reset Value |
|-------------|--------------------|-----------------------------------------------------------------------------------------------------|-------------|
| i2c5_sr_scl | I/O(OD) | I ² C serial clock line ⁽²⁾ . Open-drain output buffer. Requires external Rp. | 1 |

⁽¹⁾ I = Input; O = Output; OD = Open Drain

⁽²⁾ This signal is also used as retiming input (the INPUTENABLE bit in the corresponding pad configuration register must be set to 1).

Table 23-3. HS I²C Input/Output Description (continued)

| Signal | I/O ⁽¹⁾ | Description | Reset Value |
|-------------|--------------------|------------------------------------------------------------------------------------|-------------|
| i2c5_sr_sda | I/O(OD) | I ² C serial data line. Open-drain output buffer. Requires external Rp. | 1 |

23.1.2.3.3 HS I²C Typical Connections Protocol and Data Format for I2C5

23.1.2.3.3.1 HS I²C Serial Data Format for I2C5

The serial data format is the same as described in [Section 23.1.2.1.3.1](#), *HS I²C Serial Data Format*.

23.1.2.3.3.2 HS I²C Data Validity for I2C5

The data validity is the same as described in [Section 23.1.2.1.3.2](#), *HS I²C Data Validity*.

23.1.2.3.3.3 HS I²C S and P Conditions for I2C5

The S and P conditions are the same as described in [Section 23.1.2.1.3.3](#), *HS I²C Start and Stop Conditions*.

23.1.2.3.3.4 HS I²C Addressing for I2C5

The master transmitter HS I²C controller I2C5 supports only the 7-bit addressing mode. For each frame, the master writes the 8-bit value (DATA) in the register specified by the 8-bit register address (RA) of the slave addressed by the slave address (SA).

23.1.2.3.3.4.1 HS I²C Data Transfer Format in F/S Mode

Figure 23-17 shows the I²C data transfer format in F/S mode for I2C5.

Figure 23-17. HS I²C Data Transfer Format in F/S Mode for I2C5

| I2C4 | I2C4_DMA_TX | S_DMA_123 | sDMA | I2C4 DMA transmit request |
| | I2C4_DMA_RX | S_DMA_124 | sDMA | I2C4 DMA receive request |

NOTE:

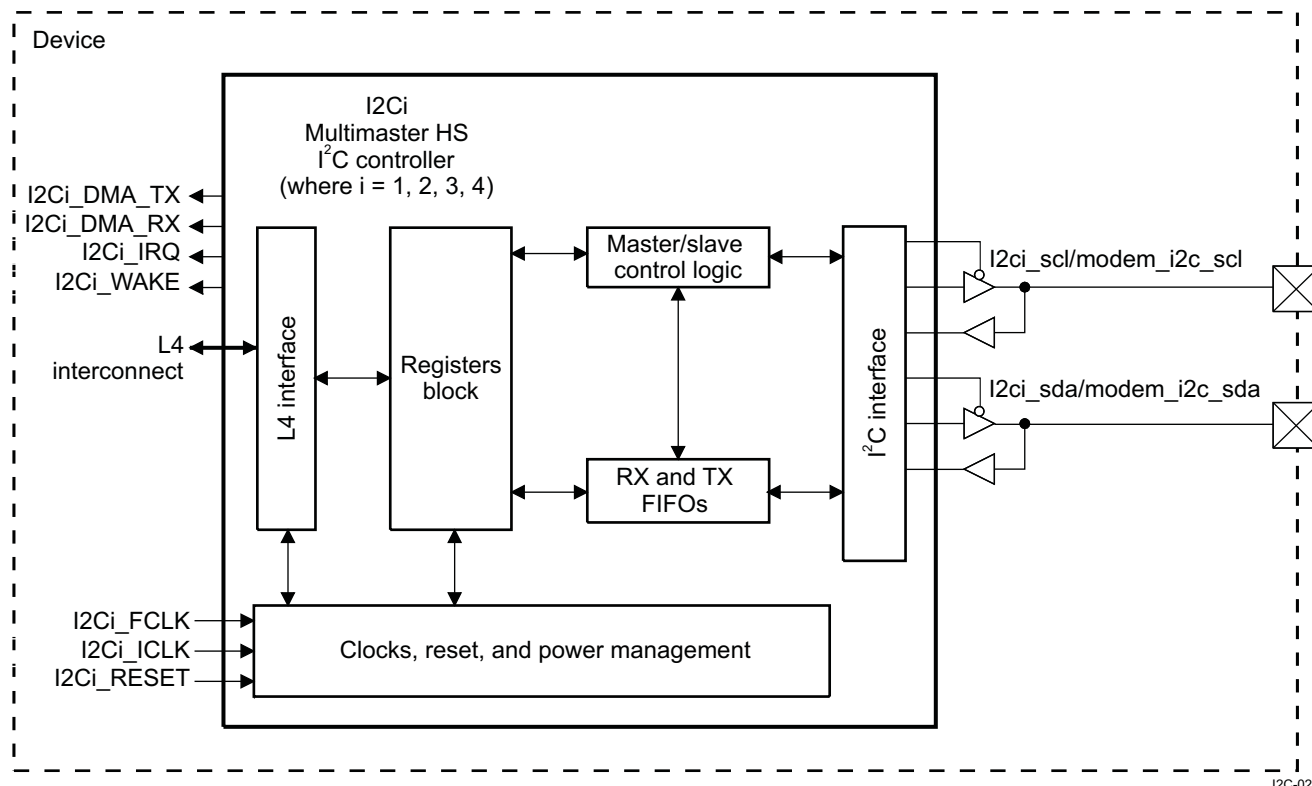

- For a description of interrupt source, see [Table 23-12](#).
- For a description of DMA source, see [Table 23-13](#).

23.1.4 HS I²C Functional Description

23.1.4.1 HS I²C Block Diagram

Figure 23-21 is the multimaster I²C HS controller block diagram.

Figure 23-21. HS I²C Block Diagram

The five multimaster HS I²C controllers can be configured in F/S I²C mode, HS I²C mode, or SCCB mode. The operation mode is selected by configuring the I2Ci.I2C_CON[13:12] OPMODE bit field. Table 23-7 lists the available operation modes.

NOTE: The fifth master transmitter HS I²C interface (I2C5) in the PRCM module can also be configured in HS mode.

Table 23-7. HS I²C Operation Mode Selection

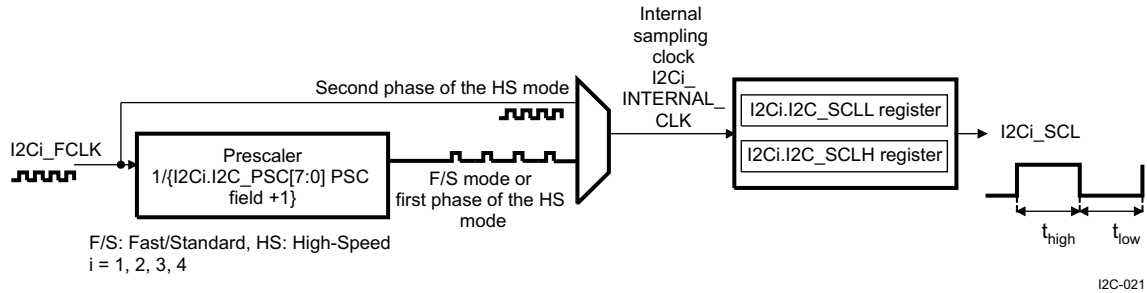

| Operation Mode | Value of I2Ci.I2C_CON[13:12] OPMODE Bit Field |
|----------------------|-----------------------------------------------|
| F/S I ² C | 0x0 |
| HS I ² C | 0x1 |
| SCCB | 0x2 |
| Reserved (not used) | 0x3 |

23.1.4.2 HS I²C Clocks

23.1.4.2.1 HS I²C Clocking

Figure 23-22 shows the I²C clock generation of the HS I²C controllers.

Figure 23-22. HS I²C Clock Generation

Each multimaster HS I²C controller uses the I2Ci_FCLK functional clock in the PRCM module. The internal sampling clock I2Ci_INTERNAL_CLK is generated by dividing the functional clock by the I2Ci.I2C_PSC[7:0] PSC bit field value + 1 in F/S mode, in SCCB mode, or in the first phase of HS mode; or by directly using the functional clock in the second phase of HS mode (prescaler is bypassed).

The low time of the I2Ci_SCL signal is determined by the I2Ci.I2C_SCLL[7:0] SCLL bit field in F/S mode, in SCCB mode, or in the first phase of HS mode; or by the I2Ci.I2C_SCLL[15:8] HSSCLL bit field in the second phase of HS mode.

The high time of the I2Ci_SCL signal is determined by the I2Ci.I2C_SCLH[7:0] SCLH bit field in F/S mode, in SCCB mode, or in the first phase of HS mode; or by the I2Ci.I2C_SCLH[15:8] HSSCLH bit field in the second phase of HS mode.

The low time of the I2C5 signal is determined by the PRM_VC_CFG_I2C_CLK[15:8] SCLL bit field in F/S mode or in the first phase of HS mode, or by the PRM_VC_CFG_I2C_CLK[31:24] HSSCLL bit field in the second phase of HS mode.

The high time of the I2C5 signal is determined by the PRM_VC_CFG_I2C_CLK[7:0] SCLH bit field in F/S mode or in the first phase of HS mode, or by the PRM_VC_CFG_I2C_CLK[23:16] HSSCLH bit field in the second phase of HS mode.

Table 23-8 lists the T_{LOW} and T_{HIGH} values in master mode only (in slave mode, the I²C controller does not generate the I²C clock).

Table 23-8. HS I²C T_{LOW} and T_{HIGH} Values of the I²C Clock

| Mode | I ² C Clock | t_{LOW} | t_{HIGH} | |
|--------------------------------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| | | | DFILTEREN bit = 0 | DFILTEREN bit = 1 |
| F/S, SCCB, or HS first phase | $I2Ci_INTERNAL_CLK = I2Ci_FCLK / (\{I2Ci.I2C_PSC[7:0] PSC\ bit\ field + 1\})$ | $(\{I2Ci.I2C_SCLL[7:0] SCLL\ bit\ field\ value + 7\} \times I2Ci_INTERNAL_CLK\ period)$ | $(\{I2Ci.I2C_SCLH[7:0] SCLH\ bit\ field\ value + 5 + PROP_DELAY0\} \times I2Ci_INTERNAL_CLK\ period)$ | $(\{I2Ci.I2C_SCLH[7:0] SCLH\ bit\ field\ value + 5 + PROP_DELAY1\} \times I2Ci_INTERNAL_CLK\ period)$ |
| HS second phase | I2Ci_FCLK | $(\{I2Ci.I2C_SCLL[15:8] HSSCLL\ bit\ field\ value + 7\} \times I2Ci_FCLK\ period)$ | $(\{I2Ci.I2C_SCLH[15:8] HSSCLH\ bit\ field\ value + 5 + PROP_DELAY0\} \times I2Ci_FCLK\ period)$ | $(\{I2Ci.I2C_SCLH[15:8] HSSCLH\ bit\ field\ value + 5 + PROP_DELAY1\} \times I2Ci_FCLK\ period)$ |
| F/S or HS first phase for I2C5 | I2C5_FCLK | $(PRM_VC_CFG_I2C_CLK[15:8] SCLL + 1) \times I2C5_FCLK\ period)$ | $(PRM_VC_CFG_I2C_CLK[7:0] SCLH + 5 + PROP_DELAY0) \times I2C5_FCLK\ period)$ | $(PRM_VC_CFG_I2C_CLK[7:0] SCLH + 5 + PROP_DELAY1) \times I2C5_FCLK\ period)$ |

Table 23-8. HS I²C T_{LOW} and T_{HIGH} Values of the I²C Clock (continued)

| Mode | I ² C Clock | t _{LOW} | t _{HIGH} | |
|--------------------------|------------------------|-----------------------------------------------------------|-------------------------------------------------------------------------|-------------------------------------------------------------------------|
| | | | DFILTEREN bit = 0 | DFILTEREN bit = 1 |
| HS second phase for I2C5 | I2C5_FCLK | (PRM_VC_CFG_I2C_CLK[31:24] HSSCLL + 1) x I2C5_FCLK period | (PRM_VC_CFG_I2C_CLK[23:16] HSSCLH + 5 + PROP_DELAY0) x I2C5_FCLK period | (PRM_VC_CFG_I2C_CLK[23:16] HSSCLH + 5 + PROP_DELAY1) x I2C5_FCLK period |

NOTE: For HS mode, the I2Ci.I2C_SCLL[15:8] HSSCLL and I2Ci.I2C_SCLL[7:0] SCLL bit fields must be programmed (the first phase of an HS transaction is performed at F/S speed).

For HS mode, the I2Ci.I2C_SCLH[15:8] HSSCLH and I2Ci.I2C_SCLH[7:0] SCLH bit fields must be programmed (the first phase of an HS transaction is performed at F/S speed).

NOTE: The equations in Table 23-8 give the SCL timing values for SCLL/SCLH/HSSCLL/HSSCLH at HS I²C controller outputs. Actual T_{LOW} and T_{HIGH} periods may vary depending on the board (the load capacitance on the SCL signal). If necessary, any adjustments to the SCLL/SCLH/HSSCLL/HSSCLH values must be determined by measurements of actual SCL signal on the board

CAUTION

During active mode (the I2Ci.I2C_CON[15] I2C_EN bit is set to 1), make no changes to the I2Ci.I2C_SCLL and I2Ci.I2C_SCLH registers. Changes can result in unpredictable behavior.

NOTE: Each multimaster HS I²C controller can be used with an internal secondary pullup. This pullup is mandatory when the I²C controller is configured in HS mode for a bit rate of 3.4 Mbps, and the bus line capacitance exceeds 45 pF. Pullups can be programmed through:

- CONTROL_I2C_0[0] I2C1_SCL_PULLUPRESX bit or CONTROL_I2C_0[16] I2C1_SDA_PULLUPRESX bit for I2C1
- CONTROL_I2C_0[4] I2C2_SCL_PULLUPRESX bit or CONTROL_I2C_0[20] I2C2_SDA_PULLUPRESX bit for I2C2
- CONTROL_I2C_0[8] I2C3_SCL_PULLUPRESX bit or CONTROL_I2C_0[24] I2C3_SDA_PULLUPRESX bit for I2C3
- CONTROL_I2C_0[12] I2C4_SCL_PULLUPRESX bit or CONTROL_I2C_0[28] I2C4_SDA_PULLUPRESX bit for I2C4

The maximum bit rate specified by the SCCB specifications is 100 Kbps.

For more information see Section 18.4.12.9.8, *I2Cx I/Os Group Pullupresx Controls and Load Range Settings*.

Table 23-9 lists the register values for obtaining the maximum I²C bit rates and the maximum period of the filtered spikes in F/S mode and HS mode.

Table 23-9. HS I²C Register Values for Maximum I²C Bit Rates in I²C F/S, I²C HS, and SCCB Modes⁽¹⁾

| | I ² C Mode for I2Ci, where i = 1, 2, 3, 4 | | | Description | SCCB Mode for I2Ci, where i = 2, 3 | | I ² C Mode for I2C5 | | |
|---------------------------------------------------|------------------------------------------------------|-----------|-----------------|------------------------------------------------------|------------------------------------|-------------------------------|---------------------------------------------------------------------------------------------|-------------------------|---------------------------------------------------------------------------------|
| | Standard Mode | Fast Mode | High-Speed Mode | | Fast and High-Speed Mode | | | | |
| I2Ci_FCLK frequency (MHz) | 96 | | | | 96 | | 38.4 | SYS_CLK clock frequency | |
| I2Ci.I2C_PSC[7:0] PSC bit field value | 23 | 9 | 1 | Prescaler value for F/S and HS modes | 4 | Prescaler value for SCCB mode | Not accessible by software | | |
| I2Ci_INTERNAL_CLK frequency (MHz) | 4 | 9.6 | 96 | 19.2 | | | | | |
| I2Ci.I2C_SCLL[7:0] SCLL bit field value | 13 | 7 | 113 | Value for F/S mode and first phase of HS mode | 89 | Value for SCCB mode | PRM_VC_CFG_I2C_CLK[15:8] SCLL (see Chapter 3, Power, Reset, and Clock Management) | 43 | Value for F/S mode and first phase of HS mode |
| I2Ci.I2C_SCLH[7:0] SCLH bit field value | 15 | 5 | 115 | Value for F/S mode and first phase of HS mode | 91 | Value for SCCB mode | PRM_VC_CFG_I2C_CLK[7:0] SCLH (see Chapter 3, Power, Reset, and Clock Management) | 41 | Value for F/S mode and first phase of HS mode |
| Maximum bit rate (Mbps) | 0.1 | 0.4 | 0.4 | F/S mode and first phase in HS mode maximum bit rate | 0.1 | SCCB mode maximum bit rate | Maximum bit rate (Mbps) | 0.4 | F/S mode and first phase in HS mode maximum bit rate |
| Maximum filter period (ns) | 250 | 104 | 10 | | 50 | | Maximum filter period (ns) | 50 | |
| I2Ci.I2C_SCLL[15:8] HSSCLL bit field value | 12 | | | Values for second phase of HS mode | | | PRM_VC_CFG_I2C_CLK[31:24] HSSCLL (see Chapter 3, Power, Reset, and Clock Management) | 14 | Values for second phase of HS mode |
| I2Ci.I2C_SCLH[15:8] HSSCLH bit field value | 5 | | | Values for second phase of HS mode | | | PRM_VC_CFG_I2C_CLK[23:16] HSSCLH (see Chapter 3, Power, Reset, and Clock Management) | 0 | Values for second phase of HS mode |
| HS mode maximum bit rate (Mbps) | 3.31 | | | HS mode maximum bit rate | | | HS mode maximum bit rate (Mbps) | 3.2 | HS mode maximum bit rate according to the corresponding SYS_CLK clock frequency |
| Maximum filter period (ns) | 10 | | | | | | | 10 | |

⁽¹⁾ Programmable fields are in bold.

NOTE: This table presents informative values only for the configuration parameters and the I²C bus performance obtained according to these values. The delays added by the analog pads are not considered in these figures.

NOTE: For I2Ci (where i = 1, 2, 3, 4)

$$I2Ci_INTERNAL_CLK \text{ freq} = I2Ci_FCLK / (PSC + 1)$$

$$FS \text{ filter period} = 1 / I2Ci_INTERNAL_CLK$$

$$HS \text{ filter period} = 1 / I2Ci_FCLK \text{ freq}$$

- If the DFILTEREN bit = 0:
 - HS bit rate = $I2Ci_FCLK \text{ freq} / (HSSCLL + 7 + HSSCLH + 5 + PROP_DELAY0)$
 - FS bit rate = $I2Ci_INTERNAL_CLK / (SCLL + 7 + SCLH + 5 + PROP_DELAY0)$
- If the DFILTEREN bit = 1:
 - HS bit rate = $I2Ci_FCLK \text{ freq} / (HSSCLL + 7 + HSSCLH + 5 + PROP_DELAY1)$
 - FS bit rate = $I2Ci_INTERNAL_CLK / (SCLL + 7 + SCLH + 5 + PROP_DELAY1)$

For I2C5 (SR):

$$I2C5_FCLK \text{ freq} = SYS_CLK \text{ freq}$$

$$HS/FS \text{ filter period} = 1 / I2C5_FCLK \text{ freq}$$

- If the DFILTEREN bit = 0:
 - HS bit rate = $I2C5_FCLK \text{ freq} / (HSSCLL + 1 + HSSCLH + 5 + PROP_DELAY0)$
 - FS bit rate = $I2C5_FCLK \text{ freq} / (SCLL + 1 + SCLH + 5 + PROP_DELAY0)$
- If the DFILTEREN bit = 1:
 - HS bit rate = $I2C5_FCLK \text{ freq} / (HSSCLL + 1 + HSSCLH + 5 + PROP_DELAY1)$
 - FS bit rate = $I2C5_FCLK \text{ freq} / (SCLL + 1 + SCLH + 5 + PROP_DELAY1)$

DFILTEREN refers to the VC_CFG_I2C_MODE[6] DFILTEREN bit. PROP_DELAYx (where x = 0 or 1) represents frequency-normalized I/O low-to-high propagation delay.

PROP_DELAY0 = 0 or 3 (values for bit rate maximum/minimum range)

PROP_DELAY1 = 1 or 4 (values for bit rate maximum/minimum range)

23.1.4.2.2 HS I²C Automatic Blocking of the I²C Clock Feature (I²C Mode Only)

This feature offers the possibility for the LH to command the blocking of the I²C clock after the slave addressing phase, when the I²C controller is addressed by an external master device using a certain Own Address.

The release of the I²C clock can be performed independently for each Own Address (I2Ci.I2C_OA_i, where i = 1, 2, 3, 4 and I2Ci.I2C_OAx registers, where x = 1, 2, 3) by deasserting the corresponding bit in the I2Ci.I2C_SBLOCK register.

23.1.4.3 HS I²C Software Reset

Each multimaster HS I²C controller supports the software reset by accessing the I2Ci.I2C_SYSC[1] SRST bit (1: reset; 0: normal mode).

The software reset status can be checked by accessing the I2Ci.I2C_SYSS[0] RDONE bit (1: reset is done; 0: reset is ongoing).

To perform a software reset:

1. Ensure that the module is disabled (clear the I2Ci.I2C_CON[15] I2C_EN bit to 0).
2. Set the I2Ci.I2C_SYSC[1] SRST bit to 1.
3. Enable the module by setting I2Ci.I2C_CON[15] I2C_EN bit to 1.
4. Check the I2Ci.I2C_SYSS[0] RDONE bit until it is set to 1 to indicate the software reset is complete.

NOTE: The I2Ci.I2C_CON[15] I2C_EN bit can hold the functional clock domain of the multimaster HS I²C controller in reset after the device reset has been released. When the system bus reset is removed, this bit remains cleared. The functional part of the I²C controller is held in reset state while this bit is 0, and all configuration registers can be accessed.

The I2Ci.I2C_CON[15] I2C_EN bit must be set to 1 to enable the functional part of the I²C controller.

The I2Ci.I2C_SYSS[0] RDONE bit is asserted only after the module is enabled by setting the I2Ci.I2C_CON[15] I2C_EN bit to 1.

23.1.4.4 HS I²C Power Management

Table 23-10 describes power-management features available for the multimaster HS I²C controllers.

NOTE:

- For information about source clock gating and sleep/wake-up transitions description, see Section 3.1.1.1.2, *Module Level Clock Management*, in Chapter 3, *Power, Reset, and Clock Management*.
 - For descriptions of EnaWakeUp, IdleMode, ClockActivity, and StandbyMode features, see Section 3.1.1.1.2, *Module Level Clock Management*, in Chapter 3, *Power, Reset, and Clock Management*.
-

Table 23-10. HS I²C Local Power-Management Features

| Feature | Registers | Description |
|-----------------------|----------------------------------|--------------------------------------------------------------------------------------|
| Clock auto gating | I2Ci.I2C_SYSC[0] AUTOIDLE | This bit allows a local power optimization inside the module |
| Slave idle modes | I2Ci.I2C_SYSC[4:3] IDLEMODE | Force-idle, no-idle, smart-idle, and smart-idle wake-up-capable modes are available. |
| Clock activity | I2Ci.I2C_SYSC[9:8] CLOCKACTIVITY | For configuration details, see Table 23-11. |
| Global wake-up enable | I2Ci.I2C_SYSC[2] ENAWAKEUP | This bit enables the wake-up feature at module level. |

NOTE: The voltage controllers, in which the HS I²C controller I2C5 are implemented, have no idle request/acknowledge mechanism. The idle modes for the voltage controllers are directly managed by the PRCM module.

Table 23-11. HS I²C Clock Activity Settings

| I2Ci.I2C_SYSC[9:8] CLOCKACTIVITY | Clock State When Module is in IDLE State | | Features Available/Unavailable When Module is in IDLE State |
|-------------------------------------|------------------------------------------|----------|-------------------------------------------------------------|
| | I2Ci_ICLK | I2C_FCLK | |
| 00 | OFF | OFF | Both clocks are disabled |
| 10 | OFF | ON | Interface clock is disabled; functional clock is enabled |
| 01 | ON | OFF | Functional clock is disabled; interface clock is enabled |
| 11 | ON | ON | Both clocks are enabled |

CAUTION

The PRCM module has no hardware means of reading the settings of CLOCKACTIVITY. Thus, software must ensure consistent programming between the I2C CLOCKACTIVITY and I2C clock PRCM control bits. For a description of the ClockActivity feature, see [Section 3.1.1.1.2, Module Level Clock Management](#) in [Chapter 3, Power, Reset, and Clock Management](#).

23.1.4.5 HS I²C Interrupt Requests

[Table 23-12](#) lists the event flags, and their mask, that can cause module interrupts.

Table 23-12. HS I²C Events

| Event Flag | Event Mask | Event Unmask | Map to | Description |
|----------------------------|-----------------------------------|------------------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| I2Ci.I2C_IRQSTATUS[0] AL | I2Ci.I2C_IRQENABLE_SET[0] AL_IE | I2Ci.I2C_IRQENABLE_C LR[0] AL_IE | I2Ci_IRQ | Arbitration lost IRQ enabled status. This bit is automatically set by the hardware when it loses the Arbitration in master transmit mode, an interrupt is signaled to the MPU subsystem. During reads, it always returns 0. |
| I2Ci.I2C_IRQSTATUS[1] NACK | I2Ci.I2C_IRQENABLE_SET[1] NACK_IE | I2Ci.I2C_IRQENABLE_C LR[1] NACK_IE | I2Ci_IRQ | No acknowledgment IRQ enabled status. Bit is set when No Acknowledge has been received, an interrupt is signaled to MPU subsystem. Write 1 to clear this bit. |
| I2Ci.I2C_IRQSTATUS[2] ARDY | I2Ci.I2C_IRQENABLE_SET[2] ARDY_IE | I2Ci.I2C_IRQENABLE_C LR[2] ARDY_IE | I2Ci_IRQ | Register access ready IRQ enabled status. When set to 1 it indicates that previous access has been performed and registers are ready to be accessed again. An interrupt is signaled to MPU subsystem. Write 1 to clear. |
| I2Ci.I2C_IRQSTATUS[3] RRDY | I2Ci.I2C_IRQENABLE_SET[3] RRDY_IE | I2Ci.I2C_IRQENABLE_C LR[3] RRDY_IE | I2Ci_IRQ | Receive data ready IRQ enabled status. Set to 1 by core when receiver mode, a new data is able to be read. When set to 1 by core, an interrupt is signaled to MPU subsystem. Write 1 to clear. |

Table 23-12. HS I²C Events (continued)

| Event Flag | Event Mask | Event Unmask | Map to | Description |
|--------------------------------|-------------------------------------------|-------------------------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| I2Ci.I2C_IRQSTATUS[4] XRDY | I2Ci.I2C_IRQENABLE_SET[4] XRDY_IE | I2Ci.I2C_IRQENABLE_C LR[4] XRDY_IE | I2Ci_IRQ | Transmit data ready IRQ enabled status. Set to 1 by core when transmitter and when new data is requested. When set to 1 by core, an interrupt is signaled to MPU subsystem. Write 1 to clear. |
| I2Ci.I2C_IRQSTATUS[5] GC | I2Ci.I2C_IRQENABLE_SET[5] GC_IE | I2Ci.I2C_IRQENABLE_C LR[5] GC_IE | I2Ci_IRQ | General call IRQ enabled status. Set to 1 by core when General call address detected and interrupt signaled to MPU subsystem. Write 1 to clear. |
| I2Ci.I2C_IRQSTATUS[6] STC | I2Ci.I2C_IRQENABLE_SET[6] STC_IE | I2Ci.I2C_IRQENABLE_C LR[6] STC_IE | I2Ci_IRQ | Start Condition IRQ enabled status. |
| I2Ci.I2C_IRQSTATUS[7] AERR | I2Ci.I2C_IRQENABLE_SET[7] AERR_IE | I2Ci.I2C_IRQENABLE_C LR[7] AERR_IE | I2Ci_IRQ | Access Error IRQ enabled status. |
| I2Ci.I2C_IRQSTATUS[8] BF | I2Ci.I2C_IRQENABLE_SET[8] BF_IE | I2Ci.I2C_IRQENABLE_C LR[8] BF_IE | I2Ci_IRQ | Access Error IRQ enabled status. |
| I2Ci.I2C_IRQSTATUS[9] AAS | I2Ci.I2C_IRQENABLE_SET[9] AAS_IE | I2Ci.I2C_IRQENABLE_C LR[9] AAS_IE | I2Ci_IRQ | Address recognized as slave IRQ enabled status. |
| I2Ci.I2C_IRQSTATUS[10] XUDF | I2Ci.I2C_IRQENABLE_SET[1 0] XUDF_IE | I2Ci.I2C_IRQENABLE_C LR[10] XUDF_IE | I2Ci_IRQ | Transmit underflow enabled status. Writing into this bit has no effect. |
| I2Ci.I2C_IRQSTATUS[11] ROVR | I2Ci.I2C_IRQENABLE_SET[1 1] ROVR_IE | I2Ci.I2C_IRQENABLE_C LR[11] ROVR_IE | I2Ci_IRQ | Receive overrun enabled status. Writing into this bit has no effect. |
| I2Ci.I2C_IRQSTATUS[12] BB | - | - | I2Ci_IRQ | Bus busy status. |
| I2Ci.I2C_IRQSTATUS[13] RDR | I2Ci.I2C_IRQENABLE_SET[1 3] RDR_IE | I2Ci.I2C_IRQENABLE_C LR[13] RDR_IE | I2Ci_IRQ | Receive draining IRQ enabled status. |
| I2Ci.I2C_IRQSTATUS[14] XDR | I2Ci.I2C_IRQENABLE_SET[1 4] XDR_IE | I2Ci.I2C_IRQENABLE_C LR[14] XDR_IE | I2Ci_IRQ | Transmit draining IRQ enabled status. |

23.1.4.6 HS I²C DMA Requests

Each multimaster HS I²C controller can generate two DMA requests to the system DMA (sDMA) controller. [Table 23-13](#) lists the DMA requests with mapping on the sDMA controller. For information about DMA generation, see [Section 23.1.4.8.3, HS I²C FIFO DMA Mode \(I²C Mode Only\)](#).

Table 23-13. HS I²C DMA Requests

| Name | Source | Destination | Description |
|-------------|--------|-------------|------------------------------------------------------------------------------------------------|
| I2C1_DMA_TX | I2C1 | S_DMA_26 | I2C1 DMA write request to inform the sDMA to write new data in the I2C1.I2C_DATA[7:0] register |
| I2C1_DMA_RX | I2C1 | S_DMA_27 | I2C1 DMA read request to inform the sDMA to read the data in the I2C1.I2C_DATA[7:0] register |
| I2C2_DMA_TX | I2C2 | S_DMA_28 | I2C2 DMA write request to inform the sDMA to write new data in the I2C2.I2C_DATA[7:0] register |
| I2C2_DMA_RX | I2C2 | S_DMA_29 | I2C2 DMA read request to inform the sDMA to read the data in the I2C2.I2C_DATA[7:0] register |
| I2C3_DMA_TX | I2C3 | S_DMA_24 | I2C3 DMA write request to inform the sDMA to write new data in the I2C3.I2C_DATA[7:0] register |
| I2C3_DMA_RX | I2C3 | S_DMA_25 | I2C3 DMA read request to inform the sDMA to read the data in the I2C3.I2C_DATA[7:0] register |

Table 23-13. HS I²C DMA Requests (continued)

| Name | Source | Destination | Description |
|-------------|--------|-------------|------------------------------------------------------------------------------------------------|
| I2C4_DMA_TX | I2C4 | S_DMA_123 | I2C4 DMA write request to inform the sDMA to write new data in the I2C4.I2C_DATA[7:0] register |
| I2C4_DMA_RX | I2C4 | S_DMA_124 | I2C4 DMA read request to inform the sDMA to read the data in the I2C4.I2C_DATA[7:0] register |

NOTE: The HS I²C controller I2C5 does not generate any DMA requests.

23.1.4.7 HS I²C Programmable Multislave Channel Feature (I²C Mode Only)

This feature allows each multimaster HS I²C controller to be addressed using four separate Own Addresses configured in the I2Ci.I2C_OA and I2Ci.I2C_OAx registers (where x = 1, 2, 3). An additional register (I2Ci.I2C_ACTOA) is used to indicate to the LH which address is used by the external master to communicate with the I²C controller.

Each Own Address can be independently configured in 7-bit or 10-bit mode by setting the corresponding bit (I2Ci.I2C_CON[7] XOA, I2Ci.I2C_CON[6] XOA1, I2Ci.I2C_CON[5] XOA2, or I2Ci.I2C_CON[4] XOA3).

23.1.4.8 HS I²C FIFO Management

Each multimaster HS I²C controller implements two internal 8-bit FIFOs, the RX and TX FIFOs.

The depth of the RX and TX FIFOs is fixed at 16 bytes and can be checked by reading the I2Ci.I2C_BUFSTAT[15:14] FIFODEPTH bit field (0x0: 8 bytes, 0x1: 16 bytes, 0x2: 32 bytes, and 0x3: 64 bytes).

NOTE: FIFO depth is configured at design time and cannot be modified by software. FIFO thresholds must not exceed configured FIFO depth.

23.1.4.8.1 HS I²C FIFO Interrupt Mode

In first in first out (FIFO) interrupt mode (relevant interrupts enabled by the I2Ci.I2C_IE register), an interrupt signal informs the processor of the receiver and transmitter status. These interrupts are raised when the RX/TX FIFO thresholds (defined by the I2Ci.I2C_BUF[13:8] RTRSH bit field value + 1 for the RX FIFO or the I2Ci.I2C_BUF[5:0] TXTRSH bit field value + 1 for the TX FIFO) are reached; the interrupt signals instruct the LH to transfer data to the destination (from the I²C controller in receive mode and/or from any source to the I²C controller FIFO in transmit mode).

Figure 23-23 and Figure 23-24 show receive and transmit operations, respectively, from a FIFO management point of view.

Figure 23-23. HS I²C Receive FIFO Interrupt Request Generation

I2C-022

In [Figure 23-23](#), the RRDY interrupt condition shows that the condition for generating an RRDY interrupt is achieved. The interrupt request is generated when this signal is active, and it can be cleared only by the LH by writing 1 in the I2Ci.I2C_STAT[3] RRDY bit. If the condition is still present after clearing the previous interrupt, another interrupt request is generated.

In receive mode, an RRDY interrupt is generated as soon as the FIFO reaches its receive threshold (I2Ci.I2C_BUF[13:8] RTRSH bit field value + 1). The interrupt can be deasserted only when the LH has handled enough bytes to make the number of bytes in the RX FIFO lower than the programmed threshold. For each interrupt, the LH can be configured to read a number of bytes equal to the value of the RX FIFO threshold.

Figure 23-24. HS I²C Transmit FIFO Interrupt Request Generation

I2C-023

In [Figure 23-24](#), the XRDY interrupt condition shows that the condition for generating an XRDY interrupt is achieved. The interrupt request is generated when TX FIFO is empty or when the TX FIFO threshold is not reached, and the LH can clear the XRDY status bit by setting the I2Ci.I2C_STAT[4] XRDY bit to 1 after transmitting the configured number of bytes. If the condition is still present after clearing the previous interrupt, another interrupt request is generated.

In interrupt mode, the module offers two options for the LH application to handle the interrupts:

- When detecting an interrupt request (XRDY or RRDY type), the LH can write/read 1 data byte to/from the TX/RX FIFO and then clear the interrupt. The module reasserts the interrupt until the interrupt condition is not met.

- When detecting an interrupt request (XRDY or RRDY type), the LH can be programmed to write/read the amount of data bytes specified by the corresponding FIFO threshold ($I2C_BUF[5:0] TXTRSH + 1$ or $I2C_BUF[5:0] RXTRSH + 1$). In this case, the interrupt condition is cleared and the next interrupt is asserted again when the XRDY or RRDY condition is met again.

If the second-interrupt-serving approach is used, an additional mechanism (draining feature) is implemented for cases where the transfer length is not a multiple of the FIFO threshold value (see [Section 23.1.4.8.4, Draining Feature \[I²C Mode Only\]](#)).

NOTE: In slave transmit mode (the I2Ci.I2C_CON[10] MST bit is cleared and the I2Ci.I2C_CON[9] TRX bit is set to 1), the draining feature must not be used, because the transfer length is not known at configuration time, and the external master can end the transfer at any point by not acknowledging 1 data byte. If the draining feature is used in slave transmit mode, data can remain in the TX FIFO without being transmitted over the I²C bus. In this case, the TX FIFO must be cleared by setting the I2Ci.I2C_BUF[6] TXFIFO_CLR bit.

NOTE: In SCCB mode, the RX and TX threshold values must be set to 1 by setting the I2Ci.I2C_BUF[13:8]RTRSH and I2Ci.I2C_BUF[5:0] TXTRSH fields to 0x0.

23.1.4.8.2 HS I²C FIFO Polling Mode

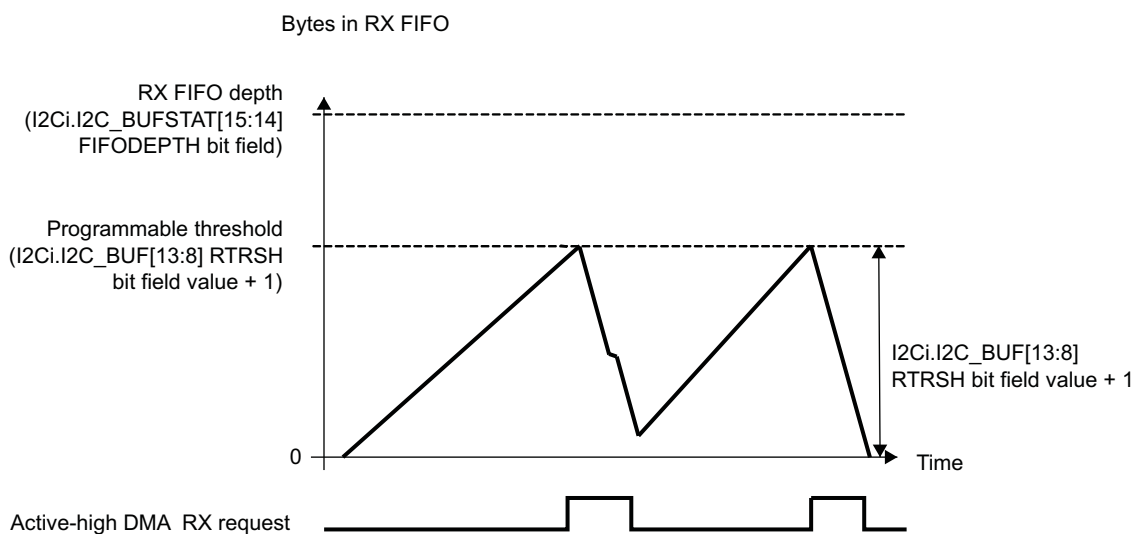

In FIFO polling mode (the I2Ci.I2C_IE[4] XRDY_IE and I2Ci.I2C_IE[3] RRDY_IE bits are disabled, and the I2Ci.I2C_BUF[15] RDMA_EN and I2Ci.I2C_BUF[7] XDMA_EN bits are disabled), the status of the module (receiver or transmitter) can be checked by polling the I2Ci.I2C_STAT[4] XRDY and the I2Ci.I2C_STAT[3] RRDY bits (the I2Ci.I2C_STAT[13] RDR and I2Ci.I2C_STAT[14] XDR bits can also be polled if the draining feature is enabled). The I2Ci.I2C_STAT[4] XRDY and I2Ci.I2C_STAT[3] RRDY bits accurately reflect the interrupt conditions described in the discussion of FIFO interrupt mode.

23.1.4.8.3 HS I²C FIFO DMA Mode (I²C Mode Only)

In receive mode, a DMA request is generated by the I2Ci_DMA_RX signal as soon as the RX FIFO exceeds its threshold level (the I2Ci.I2C_BUF[13:8] RTRSH bit field value + 1). This request is deasserted when the number of bytes defined by the threshold level is read by the DMA controller.

[Figure 23-25](#) shows the DMA request generation in receive mode.

Figure 23-25. HS I²C Receive FIFO DMA Request Generation

I2C-024

In transmit mode, a DMA request is automatically asserted by the I2Ci_DMA_TX signal when the TX FIFO is empty. This request is deasserted when the number of bytes (the 2Ci.I2C_BUF[5:0] TXTRSH bit field value + 1) is written in the FIFO by the DMA controller. If an insufficient number of bytes is written, the sDMA request remains active. Figure 23-26 and Figure 23-27 show the DMA TX transfers with different values for the I2Ci.I2C_BUF[5:0] TXTRSH bit field.

Figure 23-26. HS I²C Transmit FIFO Request Generation (High Threshold)

I2C-025

Figure 23-27. HS I²C Transmit FIFO Request Generation (Low Threshold)

I2C-026

NOTE: In SCCB mode, the RX and TX threshold values must be set to 1 by setting the I2Ci.I2C_BUF[13:8] RTRSH and I2Ci.I2C_BUF[5:0] XTRSH bit fields to 0x0.

The I²C module allows the user to clear the RX or TX FIFO by setting the I2Ci.I2C_BUF[14] RXFIFO_CLR and I2Ci.I2C_BUF[6] TXFIFO_CLR registers, respectively, which act like software reset for the FIFOs. In DMA mode, these bits also reset the DMA state-machines. The FIFO clearing feature can be used when the following conditions are met:

- The module is configured as a transmitter.
- The external receiver responds with a NACK in the middle of the transfer.
- Data in the TX FIFO is waiting to be transferred.

23.1.4.8.4 HS I²C Draining Feature (I²C Mode Only)

The draining feature is implemented to handle the end of a transfer whose length is not a multiple of the FIFO threshold values (the I2Ci.I2C_BUF[13:8] RTRSH bit field value + 1 for the RX threshold and I2Ci.I2C_BUF[5:0] TXTRSH field value + 1 for the TX threshold). It can also transfer the remaining number of bytes (because the threshold is not reached).

This feature prevents the LH or the DMA controller from trying more FIFO accesses than necessary (for example, to generate at the end of a transfer a DMA RX request having fewer bytes in the FIFO than the configured DMA transfer length). Otherwise, an AERR interrupt is generated by the I2Ci.I2C_STAT[7] AERR bit.

The draining mechanism generates an interrupt using the I2Ci.I2C_STAT[13] RDR or I2Ci.I2C_STAT[14] XDR bit at the end of the transfer, informing the LH that it must check the amount of data left to be transferred (the I2Ci.I2C_BUFSTAT[13:8] RXSTAT or I2Ci.I2C_BUFSTAT[5:0] TXSTAT bit fields) and enable the draining feature of the DMA controller by reconfiguring the DMA transfer length according to this value (when the DMA mode is enabled) or perform only the required number of data accesses (when the DMA mode is disabled).

In receive mode (master or slave), if the RX FIFO threshold (the I2Ci.I2C_BUF[13:8] RTRSH bit field value + 1) is not reached, but the transfer ends on the I²C bus and data remains in the RX FIFO (less than the threshold), the receive draining interrupt (the I2Ci.I2C_STAT[13] RDR bit) is asserted to inform the LH that it can read the amount of data in the RX FIFO (the I2Ci.I2C_BUFSTAT[13:8] RXSTAT bit field). The LH performs a number of data read accesses equal to the I2Ci.I2C_BUFSTAT[13:8] RXSTAT bit field (interrupt or polling mode), or reconfigures the sDMA controller with the required value to drain the FIFO.

In master transmit mode, if the TX FIFO threshold (I2Ci.I2C_BUF[5:0] TXTRSH bit field value + 1) is not reached, but the amount of data remaining to be written in the TX FIFO is less than the threshold, the transmit draining interrupt (the I2Ci.I2C_STAT[14] XDR bit) is asserted to inform the LH that it can read the amount of data remaining to be written in the TX FIFO (the I2Ci.I2C_BUFSTAT[5:0] TXSTAT bit field). The LH must write the required number of data bytes specified by the I2Ci.I2C_BUFSTAT[5:0] TXSTAT bit field value or reconfigure the sDMA controller with the value required to transfer the last bytes to the FIFO.

In master mode, the LH can alternately not check the values of the I2Ci.I2C_BUFSTAT[5:0] TXSTAT and I2Ci.I2C_BUFSTAT[13:8] RXSTAT bit fields, the LH can obtain this information internally (by computing the I2Ci.I2C_CNT[15:0] DATACOUNT bit field value modulo I2Ci.I2C_BUF[13:8] RTRSH or I2Ci.I2C_BUF[5:0] TXTRSH).

By default, the draining feature is disabled; it can be enabled using the I2Ci.I2C_IE[14] XDR_IE or I2Ci.I2C_IE[13] RDR_IE bits (default disabled) only for transfers with lengths not equal to the threshold values (I2Ci.I2C_BUF[5:0] TXTRSH bit field value + 1 for the TX threshold or I2Ci.I2C_BUF[13:8] RTRSH bit field value + 1 for the RX threshold).

23.1.4.9 HS I²C Noise Filter

The noise filter is used to suppress any noise that is 50 ns or less in case of F/S operation modes and SCCB modes, and any noise that is 10 ns or less in case of HS mode operation. The noise filter is always one period of the I2Ci_INTERNAL_CLK clock. This way, for HS mode operation (prescaler bypassed), the filter suppresses spikes of less than 10.4 ns.

For SCCB modes (for example, I2Ci.I2C_PSC[7:0] PSC bit field = 4), the maximum width of suppressed spikes is 52 ns.

To ensure correct filtering, the prescaler must be programmed accordingly by the I2Ci.I2C_PSC[7:0] PSC bit field.

23.1.4.10 HS I²C Write and Read Operations in SCCB Mode

In SCCB mode, the multimaster HS I²C controller can write or read a single byte to or from the external SCCB device.

To write a single byte to the external SCCB device, the multimaster HS I²C controller must be configured in multimaster transmitter mode by setting the I2Ci.I2C_CON[10] MST and I2Ci.I2C_CON[9] TRX bits to 1. The external device slave address (7-bit address of the ID value) is set in the I2Ci.I2C_SA register; the register address (8-bit subaddress in the external SCCB device) is set in the I2Ci.I2C_OA0 register. The 8-bit data to be transmitted is written by the LH in the I2Ci.I2C_DATA register.

To read a single byte from the external SCCB device, the multimaster HS I²C controller must be configured in multimaster receiver mode by setting the I2Ci.I2C_CON[10] MST bit to 1 and by clearing the I2Ci.I2C_CON[9] TRX bit to 0. The external device slave address (7-bit address of the ID value) is set in the I2Ci.I2C_SA register; the register address (8-bit subaddress in the external SCCB device) is set in the I2Ci.I2C_OA0 register. The 8-bit data received from the external SCCB device is read by the LH from the I2Ci.I2C_DATA register.

NOTE: In SCCB mode, the RX and TX thresholds must be set to 1 by configuring the I2Ci.I2C_BUF[13:8] RTRSH and I2Ci.I2C_BUF[5:0]XTRSH fields to 0x0.

23.1.4.11 HS I²C System Test Mode

A system test mode is available for multimaster HS I²C controller module testing. This mode is enabled by setting the I2Ci.I2C_SYSTEST[15] ST_EN bit to 1. When this bit is cleared to 0, the I²C controller is configured in normal operation mode.

In system test mode, the I2Ci_SYSTEST[13:12] TMODE bit field selects the type of test. [Table 23-14](#) lists the tests available for the multimaster HS I²C controllers.

Table 23-14. HS I²C List of Tests

| I2Ci.I2C_SYSTEST[13:12] TMODE | Test | Description |
|-------------------------------|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 00 | Functional mode | Normal operation mode |
| 01 | Reserved (not used) | |
| 10 | Test of i2ci_scl serial clock line | The i2ci_scl line is driven with a permanent clock as if mastered with the parameters set in the I2Ci.I2C_PSC, I2Ci.I2C_SCLL, and I2Ci.I2C_SCLH registers. |
| 11 | Loop-back mode + i2ci_scl/ i2ci_sda input/output | In master transmit mode only, data transmitted out of the I2Ci.I2C_DATA register (write action) is received in the same I2Ci.I2C_DATA register through an internal path through the FIFO buffers. The DMA and interrupt requests are normally generated if they are enabled. Moreover, the i2ci_scl, i2ci_sda, and i2ci_sccbe lines are controlled with the I2Ci.I2C_SYSTEST[4:0] bits.. |

NOTE: When the I2Ci.I2C_SYSTEST[13:12] TMODE bit field is set to 11, the I²C controller must be configured in I²C F/S (the I2Ci.I2C_CON[13:12] OPMODE set to 00) or I²C HS mode (the I2Ci.I2C_CON[13:12] OPMODE set to 01). The loop-back mode is not available in SCCB mode (the I2Ci.I2C_CON[13:12] OPMODE = b10).

NOTE: In normal operation mode (I2Ci.I2C_SYSTEST[15] ST_EN clear to 0), the I2Ci.I2C_SYSTEST[4:0] bits that control the i2ci_scl, i2ci_sda, and i2ci_sccbe lines in system test mode are read-only bits.

In system test mode (I2Ci.I2C_SYSTEST[15] ST_EN set to 1), the I2Ci.I2C_STAT[5:0] status bits can be set to 1 when the I2Ci.I2C_SYSTEST[11] SSB bit is set to 1. Clearing the I2Ci.I2C_SYSTEST[11] SSB bit to 0 does not clear the I2Ci.I2C_STAT[5:0] bits to 0. The I2Ci.I2C_STAT[5:0] bit field can be cleared to 0 only by writing 1 in the corresponding bits.

23.1.5 HS I²C Programming Guide

23.1.5.1 HS I²C Low-Level Programming Models

23.1.5.1.1 HS I²C Programming Model in I²C Mode

This section describes the programming model of the multimaster HS I²C controllers configured in I²C mode.

23.1.5.1.1.1 Main Program

23.1.5.1.1.1.1 Configure the Module Before Enabling the I²C Controller

Before enabling the I²C controller, perform the following:

1. Enable the functional and interface clocks.
2. Program the prescaler to obtain an approximately 12-MHz internal sampling clock by programming the corresponding value in the I2Ci.I2C_PSC[7:0] PSC field. This value depends on the frequency of the functional clock (I2Ci_FCLK).
3. Program the I2Ci.I2C_SCLL[7:0] SCLL and I2Ci.I2C_SCLH[7:0] SCLH bit fields to obtain a bit rate of 100 Kbps, 400 Kbps or 1Mbps. These values depend on the internal sampling clock frequency (see [Table 23-8](#)).
4. (Optional) Program the I2Ci.I2C_SCLL[15:8] HSSCLL and I2Ci.I2C_SCLH[15:8] HSSCLH bit fields to obtain a bit rate of 400 Kbps or 3.4 Mbps (for the second phase of HS mode). These values depend on the internal sampling clock frequency (see [Table 23-8](#)).
5. (Optional) If a bit rate of 3.4 Mbps is used and the bus line capacitance exceeds 45 pF, see [Section 18.4.8, PAD Functional Multiplexing and Configuration](#).
6. Configure the Own Address of the I2C controller by storing it in the I2Ci.I2C_OA register. Up to four Own Addresses can be programmed in the I2Ci.I2C_OAx registers (where x = 0, 1, 2, 3) for each I²C controller.

NOTE: For a 10-bit address, set the corresponding expand Own Address bit in the I2Ci.I2C_CON register.

7. Set the TX threshold (in transmitter mode) and the RX threshold (in receiver mode) by setting the I2Ci.I2C_BUF[5:0] TXTRSH bit field to (TX threshold to 1) and the I2Ci.I2C_BUF[13:8]RTRSH bit field to (RX threshold to 1), where the TX and RX thresholds are greater than or equal to 1.
8. Take the I²C controller out of reset by setting the I2Ci.I2C_CON[15] I2C_EN bit to 1.

23.1.5.1.1.1.2 Initialize the I²C Controller

To initialize the I²C controller, perform the following steps:

1. Configure the I2Ci.I2C_CON register:
 - For master or slave mode, set the I2Ci.I2C_CON[10] MST bit (0: slave; 1: master).
 - For transmitter or receiver mode, set the I2Ci.I2C_CON[9] TRX bit (0: receiver; 1: transmitter).
2. If using an interrupt to transmit and receive data, set the corresponding bit in the I2Ci.I2C_IE register to 1 (the I2Ci.I2C_IE[4] XRDY_IE bit for the transmit interrupt, the I2Ci.I2C_IE[3] RRDY bit for the receive interrupt).
3. If using DMA to receive and transmit data, set the corresponding bit in the I2Ci.I2C_BUF register to 1 (the I2Ci.I2C_BUF[15] RDMA_EN bit for the receive DMA channel, the I2Ci.I2C_BUF[7] XDMA_EN bit for the transmit DMA channel).

23.1.5.1.1.1.3 Configure Slave Address and the Data Control Register

In master mode, configure the slave address register by programming the I2Ci.I2C_SA[9:0] SA bit field and the number of data bytes (I²C data payload) associated with the transfer by programming the I2Ci.I2C_CNT[15:0] DCOUNT bit field.

NOTE: For a 10-bit address, set the I2Ci.I2C_CON[8] XSA bit to 1.

23.1.5.1.1.1.4 Initiate a Transfer

Poll the I2Ci.I2C_STAT[12] BB bit. If it is cleared to 0 (bus not busy), configure the I2Ci.I2C_CON[0] STT and I2Ci.I2C_CON[1] STP bits. To initiate a transfer, the I2Ci.I2C_CON[0] STT bit must be set to 1, and it is not mandatory to set the I2Ci.I2C_CON[1] STP bit to 1.

23.1.5.1.1.1.5 Receive Data

Poll the I2Ci.I2C_STAT[3] RRDY bit, or use the RRDY interrupt (the I2Ci.I2C_IE[3] RRDY_IE bit must be set to 1) or the DMA RX channel (the I2Ci.I2C_BUF[15] RDMA_EN bit must be set to 1) to read the receive data in the I2Ci.I2C_DATA register.

If the transfer length does not equal the RX FIFO threshold (I2Ci.I2C_BUF[13:8] RTRSH field + 1), use the draining feature (enable the RDR interrupt by setting the I2Ci.I2C_IE[13] RDR_IE bit to 1).

NOTE: In receive mode only, the I2Ci.I2C_STAT[11] ROVR (receive overrun) bit indicates whether the receiver has experienced overrun. An overrun condition occurs when the shift register and the RX FIFO are full. An overrun condition does not result in data loss; the I²C controller simply holds i2ci_scl to low to prevent other bytes from being received.

The I2Ci.I2C_STAT[7] AERR bit is set to 1 when a read access is performed in the I2Ci.I2C_DATA register while the RX FIFO is empty. The corresponding interrupt can be enabled by setting the I2Ci.I2C_IE[7] AERR_IE bit to 1.

23.1.5.1.1.1.6 Transmit Data

Poll the I2Ci.I2C_STAT[4] XRDY bit, or use the XRDY interrupt (the I2Ci.I2C_IE[4] XRDY_IE bit must be set to 1) or the DMA TX channel (the I2Ci.I2C_BUF[7] XDMA_EN bit must be set to 1) to write data to the I2Ci.I2C_DATA register.

If the transfer length does not equal the TX FIFO threshold (I2Ci.I2C_BUF[5:0] TXTRSH field + 1), use the draining feature (enable the XDR interrupt by setting the I2Ci.I2C_IE[14] XDR_IE bit to 1).

NOTE: In transmit mode only, the I2Ci.I2C_STAT[10] XUDF bit indicates whether the transmitter has experienced underflow.

In master transmit mode, underflow occurs when the shift register and the TX FIFO are empty and there are still some bytes to transmit (the value of the I2Ci.I2C_CNT[15:0] DCOUNT bit field is not 0).

In slave transmit mode, underflow occurs when the shift register and the TX FIFO are empty and the external I²C master device still requests data bytes to be read.

The I2Ci.I2C_STAT[7] AERR bit is set to 1 when a write access is performed in the I2Ci.I2C_DATA register while the TX FIFO is full. The corresponding interrupt can be enabled by setting the I2Ci.I2C_IE[7] AERR_IE bit to 1.

23.1.5.1.1.2 Interrupt Subroutine Sequence

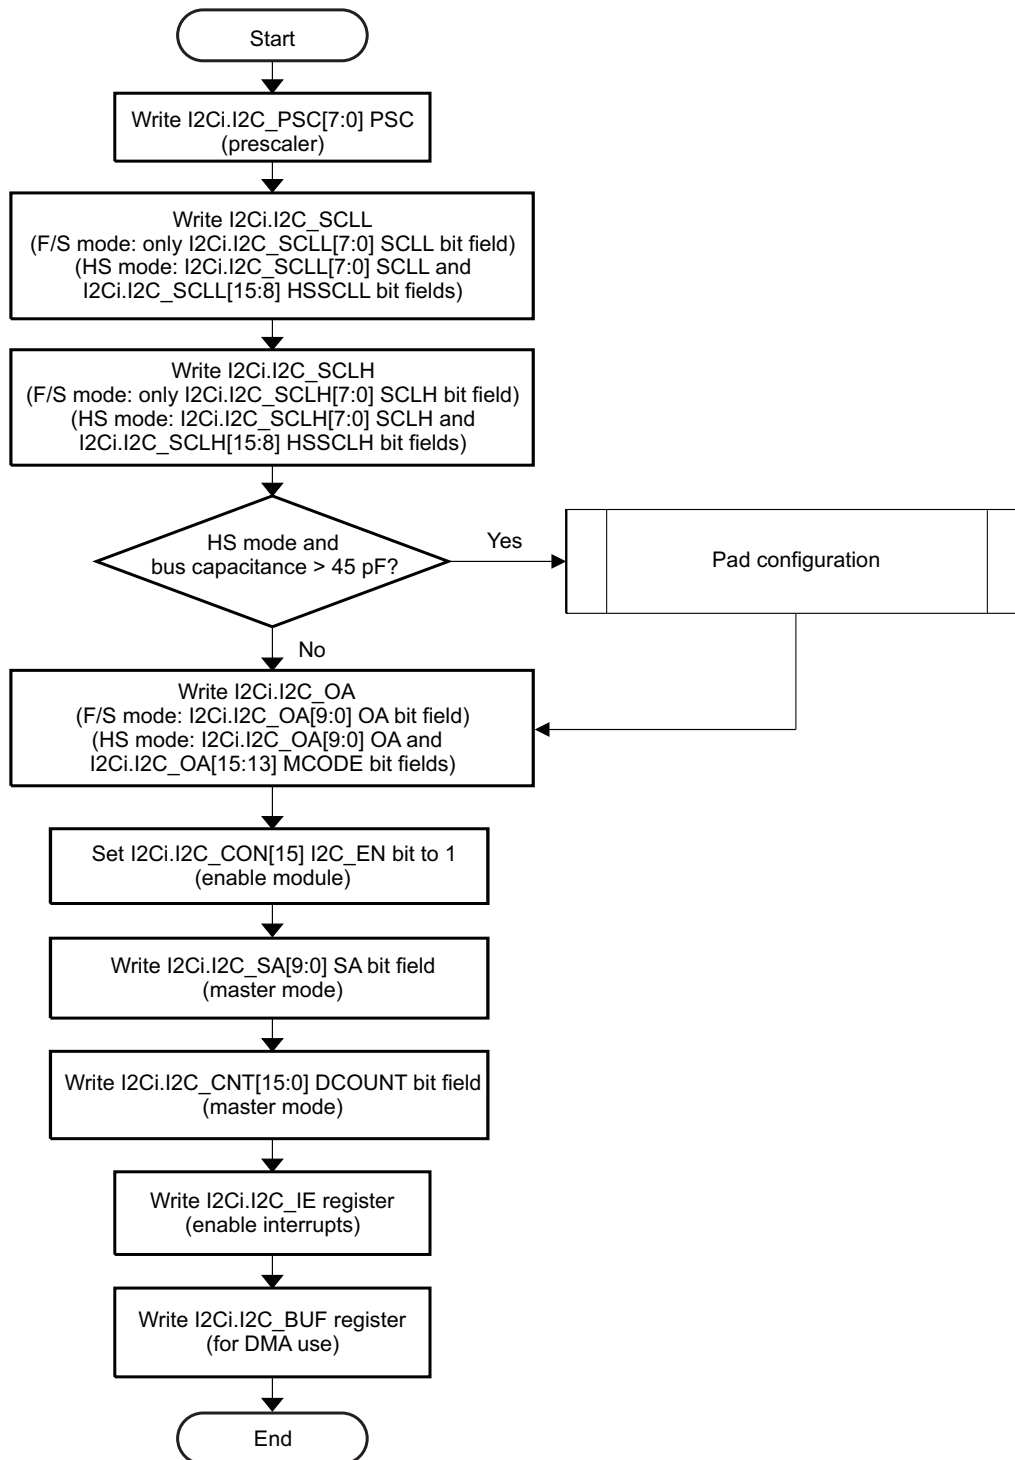

1. Test for arbitration lost (the I2Ci.I2C_STAT[0] AL bit) and resolve accordingly.
2. Test for no acknowledgment (the I2Ci.I2C_STAT[1] NACK bit) and resolve accordingly.
3. Test for register access ready (the I2Ci.I2C_STAT[2] ARDY bit) and resolve accordingly.

4. Test for receive data ready (the I2Ci.I2C_STAT[3] RRDY bit) and resolve accordingly.
5. Test for transmit data ready (the I2Ci.I2C_STAT[4] XRDY bit) and resolve accordingly.
6. Test for general call (the I2Ci.I2C_STAT[5] GC bit) and resolve accordingly.
7. Test for start (S) condition (the I2Ci.I2C_STAT[6] STC bit) and resolve accordingly. For this test, the functional clock must be inactive.
8. Test for access error (the I2Ci.I2C_STAT[7] AERR bit) and resolve accordingly.
9. Test for bus free (the I2Ci.I2C_STAT[8] BF bit) and resolve accordingly.

23.1.5.1.1.3 Programming Flow Diagrams

Figure 23-28 through Figure 23-36 are procedure flow charts for programming the F/S and HS I²C modes.

Figure 23-28. HS I²C Setup Procedure

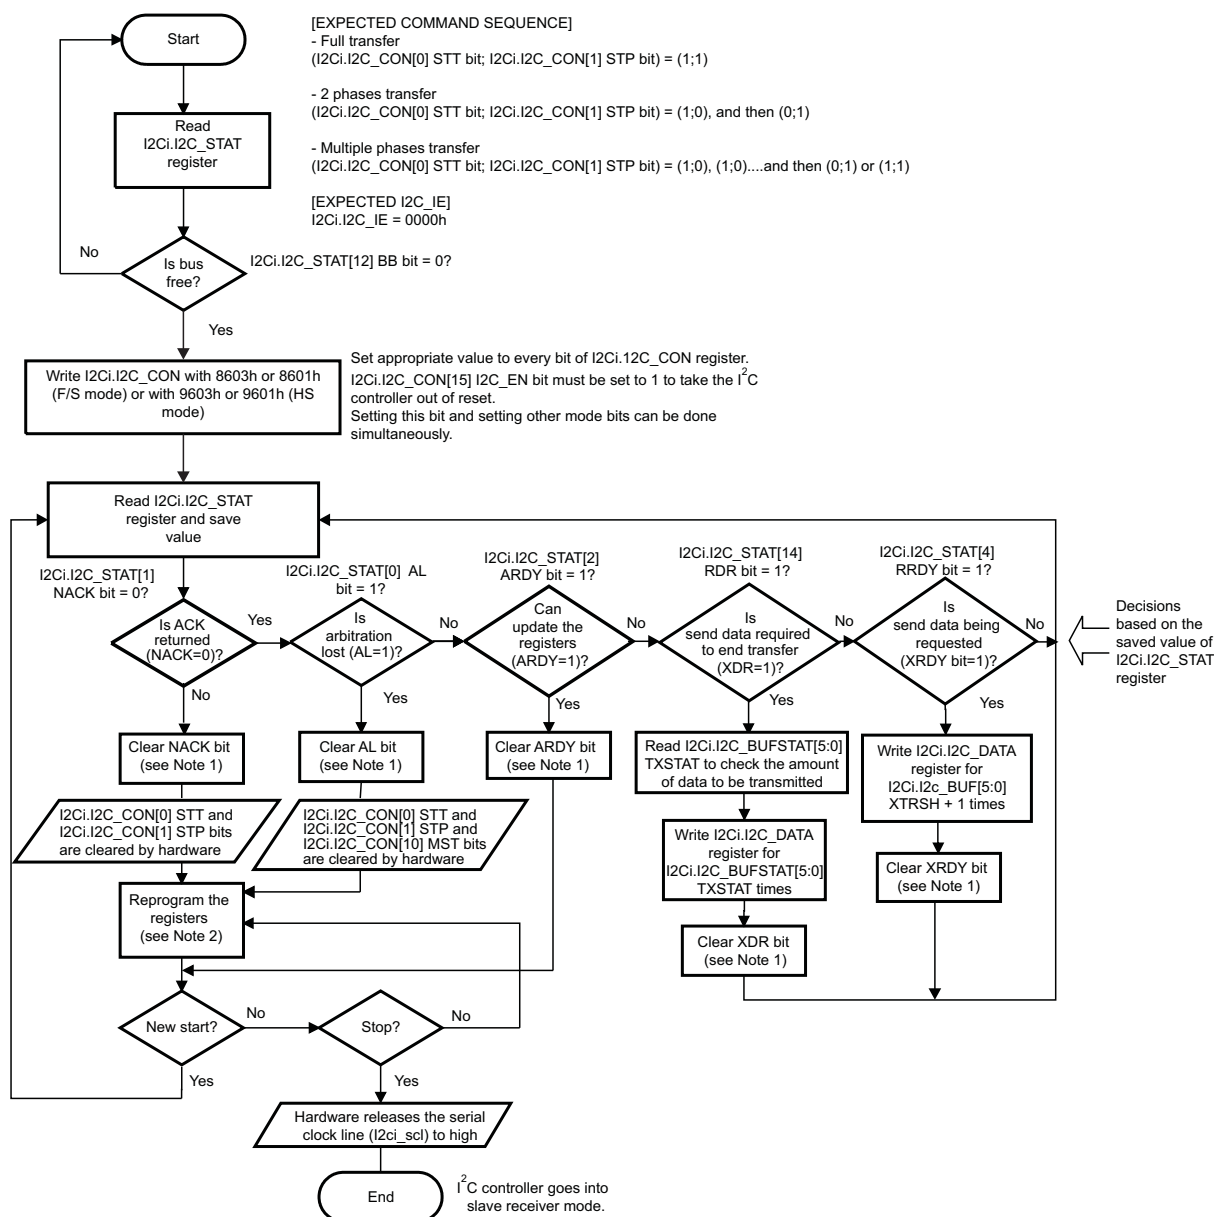

I2C-027

Table 23-15. HS I²C Subprocess call summary for Sequence - Setup Procedure

| Register Name | Register Name |
|-------------------|-----------------------------------------------------------------------------------------|
| Pad configuration | Refer to Section 18.4.8 PAD Functional Multiplexing and Configuration . |

Table 23-16. HS I²C Register call summary for Sequence - Setup Procedure

| Register Name | Register Name | Register Name |
|------------------------------|-----------------------------|-----------------------------|
| I2Ci.I2C_PSC ⁽¹⁾ | I2Ci.I2C_CON ⁽¹⁾ | I2Ci.I2C_BUF ⁽¹⁾ |
| I2Ci.I2C_SCLL ⁽¹⁾ | I2Ci.I2C_SA ⁽¹⁾ | I2Ci.I2C_IE ⁽¹⁾ |
| I2Ci.I2C_SCLH ⁽¹⁾ | I2Ci.I2C_CNT ⁽¹⁾ | I2Ci.I2C_OA ⁽¹⁾ |

⁽¹⁾ i = 1 to 4**Figure 23-29. HS I²C Master Transmitter Mode, Polling Method, in F/S and HS Modes**

I2C-028

- (1) The NACK, AL, ARDY, XDR, and XRDY bits are cleared by writing 1 to each corresponding bit in the I2Ci.I2C_STAT register.
- (2) Reprogram the registers means: I2Ci.I2C_CON[11] STB and/or I2Ci.I2C_CON[10] MST bit and/or I2Ci.I2C_SA[9:0] SA register and/or I2Ci.I2C_CNT[15:0] DCOUNT register and/or I2Ci.I2C_CON[0] STT bit and/or I2Ci.I2C_CON[1] STP bit.

NOTE: The FIFO clearing can be made when the module is configured as transmitter and the receiver sends a NACK in the middle of the transfer and data still exists in the FIFO.

Table 23-17. HS I²C Register call summary for Sequence - Master Transmitter Mode, Polling Method, in F/S and HS Modes

| Register Name | Register Name | Register Name |
|---------------------------------|------------------------------|-----------------------------|
| I2Ci.I2C_STAT ⁽¹⁾ | I2Ci.I2C_DATA ⁽¹⁾ | I2Ci.I2C_CON ⁽¹⁾ |
| I2Ci.I2C_BUFSTAT ⁽¹⁾ | I2Ci.I2C_CON ⁽¹⁾ | I2Ci.I2C_BUF ⁽¹⁾ |

⁽¹⁾ i = 1 to 4

NOTE: In HS mode, the Sr condition and clock frequency switching are automatically generated by the multimaster HS I²C controller.
